General Demographic Trends for Metropolitan Areas, 1960 to 1970

(This series consists of 52 reports—number 1 for the United States and numbers 2 thru 52 for the States and the District of Columbia in alphabetical order rather than order of publication.)

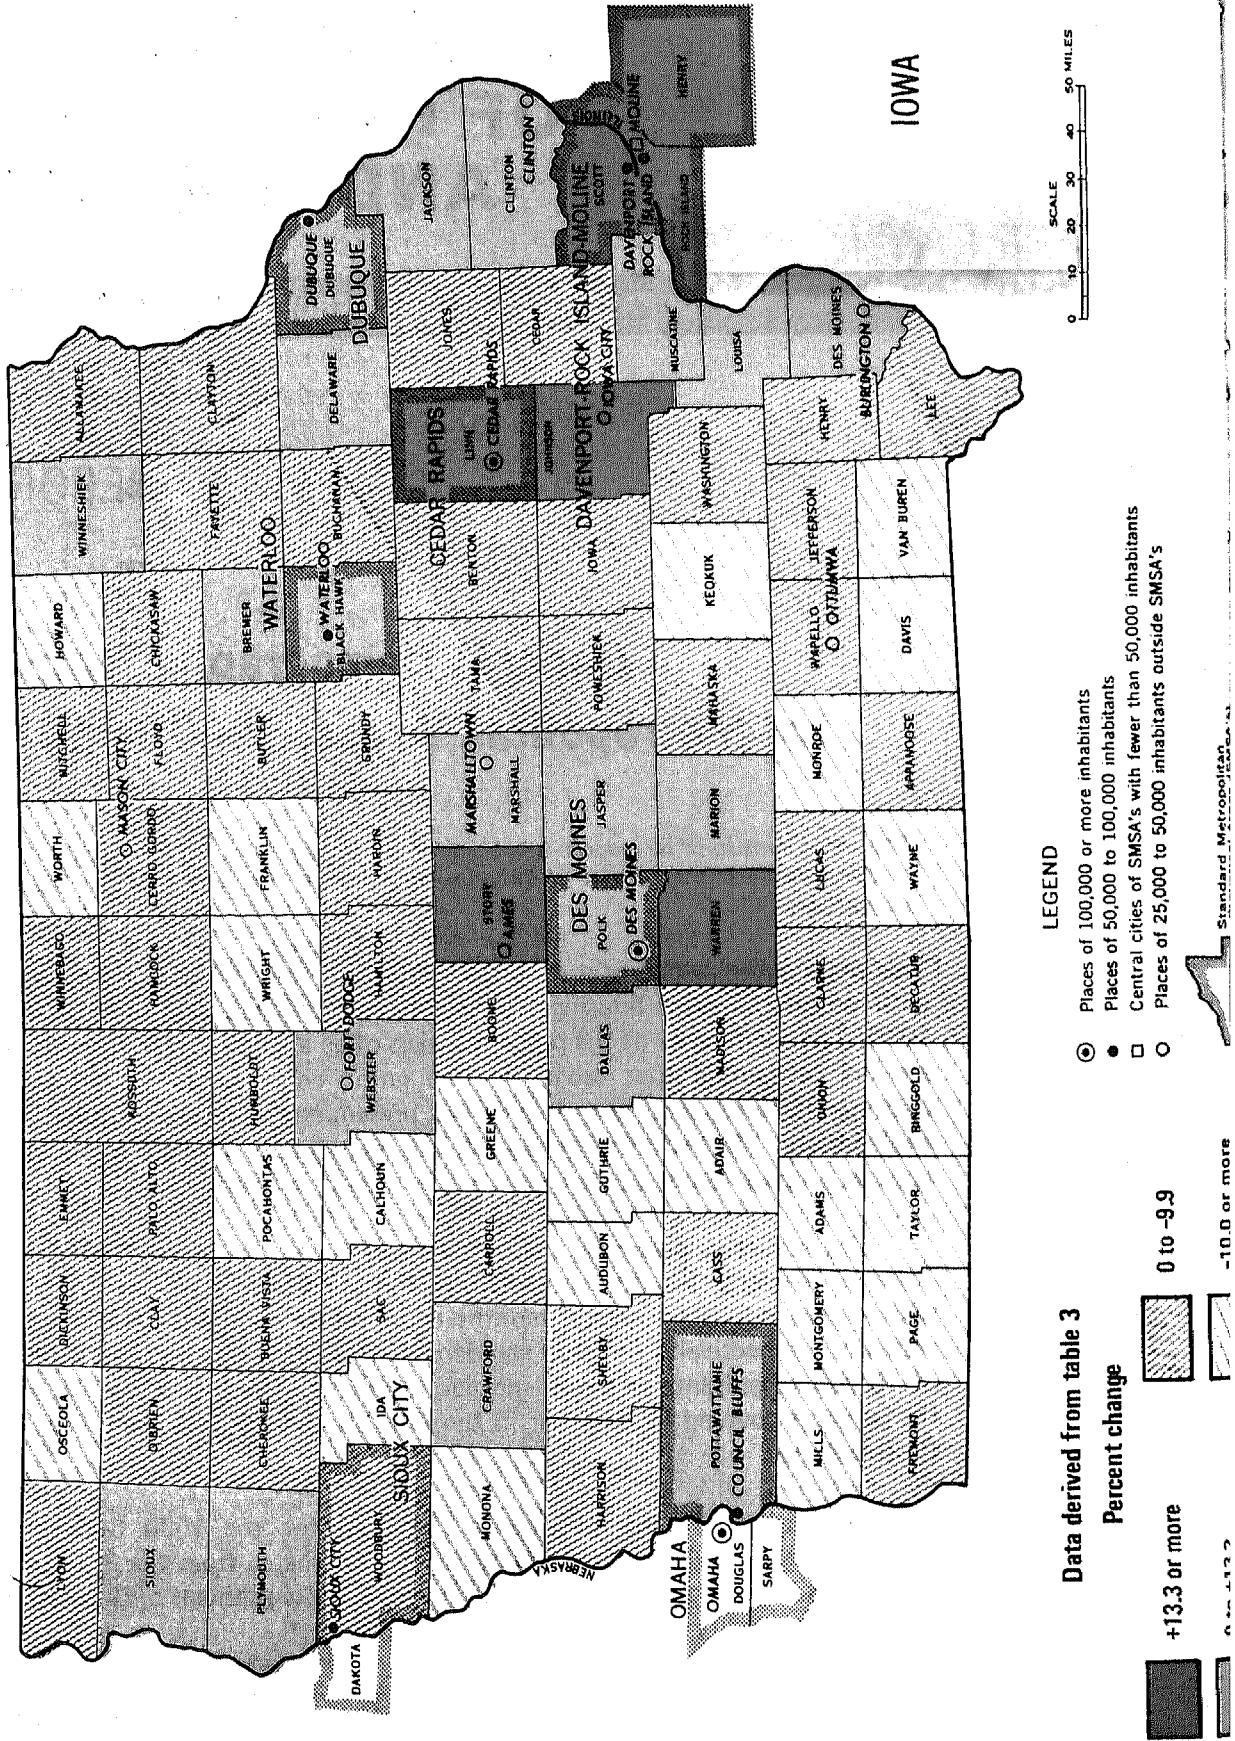

This publication is one of a series of 1970 census reports concerned mainly with population and housing trends in metropolitan areas from 1960 to 1970. The main body of the report consists of an analytical text, a statistical section containing four tables on population characteristics and one on housing characteristics, and an appendix presenting technical definitions and explanations. A map showing 1960-70 population change by county appears on page 2 and a detailed table of contents is on page 3.

The statistics presented here are drawn largely from the 1970 census Advance Reports PC(V2) and HC(V1) for this State. These two reports, which were published several months ago, provide population and housing statistics, respectively, for each standard metropolitan statistical area, place of 10,000 inhabitants or more, and county in the State. Additional data on the subjects covered here appear in the PC(1)-B and HC(1)-A Final Reports for this State.

An outline of the publication program for the 1970 Census of Population and Housing can be obtained free of charge from the Bureau of the Census, Washington, D.C. 20233, or any U.S. Department of Commerce Field Office.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, and U.S. Department of Commerce Field Offices, 25 cents.

TEXT TABLES

A. Population by race and metropolitan and nonmetropolitan residence: 1970 and 1960	4
B. Change in population of central cities through annexation: 1960 to 1970	5
C. Housing units by metropolitan and nonmetropolitan residence: 1970 and 1960	6
D. Plumbing facilities and persons per room by metropolitan and nonmetropolitan residence: 1970 and 1960	7

DETAILED TABLES

1. Population inside and outside central cities by race: 1970 and 1960	9
2. Population of standard metropolitan statistical areas and constituent counties: 1970 and 1960	11
3. Components of population change by race: 1970 and 1960	12
4. Population inside and outside central cities by race and age: 1970 and 1960	15
5. General housing characteristics: 1970 and 1960	24

APPENDIX

DEFINITIONS AND EXPLANATIONS	37
SOURCES OF DATA	42

Iowa's remaining SMSA, Sioux City, which is shared with Nebraska, had a population decrease of nearly 4,000. All of the loss was confined to the Iowa portion (Woodbury County). The county had an outmigration of 15,000 equivalent to 14 percent of its 1960 population. This SMSA was one of 22 in the Nation which had a population decline between 1960 and 1970.

Counties

Seventy-four of Iowa's 99 counties lost population between 1960 and 1970. This is not an isolated happening as 59 of the counties have less population than in 1930 with 29 of them showing continuous losses for each decade since 1930. Going back still further in time, 44 of the State's counties registered their largest population in 1900 or earlier.

Only five of the State's counties had population increases in excess of the national average of 13.3 percent. Two of them, Linn, (Cedar Rapids) and Scott (Davenport) with increases of almost precisely 20 percent, were metropolitan. The counties with the largest and third largest percentage increases, Johnson and Story, contain the two largest centers of higher learning in the State, the University of Iowa and Iowa State University. The cities in which they are located, Iowa City and Ames, respectively, accounted for most of the growth in the county.

The remaining nonmetropolitan county, Warren, which had a high rate of growth, is located directly south of Des Moines. Warren, which is just beginning to receive population spillover from Des Moines, increased its population 6,600 or 32 percent. Sixty percent of the growth in the county was the result of net immigration.

HOUSING TRENDS

General

Between 1960 and 1970, the total supply of housing units in Iowa increased more rapidly than population. The population grew by 66,800, or 2 percent, while housing units increased 58,800, or 6 percent (table C).

The metropolitan areas of the State experienced greater relative growth in housing than did the non-metropolitan part. The number of housing units in metropolitan areas rose from 291,000 to 328,900 over the decade, an increase of 37,900 units, or 13 percent; this compares with an increase of 20,900 units, or 3 percent, in nonmetropolitan areas. While metropolitan areas contained 34 percent of the housing in Iowa, the additions to the housing supply in these areas accounted for 65 percent of the State's total housing increase between 1960 and 1970.

Table C. Housing Units by Metropolitan and Nonmetropolitan Residence: 1970 and 1960

The State Metropolitan and Nonmetropolitan Residence	Housing units				Popula- tion percent change	
	Total		Change			
	1970	1960	Number	Percent		
Total.....	964,060	905,295	58,765	6.5	2.4	
Metropolitan residence.....	328,900	290,991	37,909	13.0	9.8	
Inside central cities....	216,322	198,471	17,851	9.0	4.3	
Outside central cities...	112,578	92,520	20,058	21.7	20.7	
Nonmetropolitan residence..	635,160	614,304	20,856	3.4	-1.2	

About 82 percent of the housing in Iowa consisted of one-unit structures in 1970. The number of units in multiunit structures, however, increased 41.2 percent during the decade, while the number of one-unit structures declined 0.6 percent.

The number of units in the State lacking some or all plumbing facilities declined from 179,700 in 1960 to 71,800 in 1970, a decrease of 60 percent. In 1970, the proportion of such units was 5 percent in metropolitan areas and 9 percent in nonmetropolitan areas (table D).

Approximately 800, or 9 percent, of the Negro-occupied housing units in the State lacked some or all plumbing in 1970. The corresponding proportions for inside and outside the metropolitan areas were 8 percent and 16 percent, respectively.

Households were smaller in 1970 than in 1960. In metropolitan areas average household size declined from 3.2 persons in 1960 to 3.1 in 1970, and in nonmetropolitan areas, from 3.2 to 3.0 persons. There were large percentage increases in one-person households, 41 percent in metropolitan areas and 44 percent in nonmetropolitan areas. Households with five or more persons increased 7 percent in metropolitan areas and decreased 10 percent in nonmetropolitan areas.

The median number of rooms in housing units in Iowa was 5.3 in 1970. In metropolitan areas the median was 5.0, and in nonmetropolitan areas, 5.5. About 36 percent of the housing units in metropolitan areas had six or more rooms, compared with 49 percent in the nonmetropolitan areas.

Number of persons per room is often used as a measure of crowding. In Iowa, the proportion of housing

units with 1.01 or more persons per room decreased during the decade. In 1960, 10 percent of all occupied housing units in metropolitan areas and 7 percent in nonmetropolitan areas had more than one person per room. By 1970, the proportion of such units had decreased to 7 percent inside metropolitan areas and to 5 percent outside metropolitan areas (table D).

The homeownership rate in Iowa was 72 percent in 1970 and 69 percent in 1960. The proportion of owner-occupied units rose slightly in metropolitan areas, from 70 to 71 percent, and in nonmetropolitan areas, owner-occupied units increased from 69 to 72 percent.

About 56 percent of the Negro households in metropolitan areas owned their homes in 1970, compared with 51 percent in nonmetropolitan areas. Of the 4,900 Negro-homeowner households in the State, 4,100 lived inside SMSA's and 800 lived outside SMSA's.

Property values and rents increased during the last decade. The median value of owner-occupied homes in metropolitan areas increased by 37 percent (\$12,000 in 1960 to \$16,400 in 1970) and in nonmetropolitan areas, value increased 45 percent (\$8,500 in 1960 to \$12,300 in 1970). In metropolitan areas, median contract rent in 1970 was 47 percent higher than in 1960, rising from \$62 to \$91. In nonmetropolitan areas, rent increased during the 10-year period from \$49 to \$70, or 43 percent.

Value and rent are expressed in current dollars (the value at the time of the respective censuses). Thus, any comparison must take into account the general rise in the cost of living during the 10-year period, as well as changes in the characteristics of the housing inventory.

Table D. Plumbing Facilities and Persons Per Room by Metropolitan and Nonmetropolitan Residence: 1970 and 1960

The State
Metropolitan and
Nonmetropolitan Residence

	Percent of housing units			
	Lacking some or all plumbing facilities		With 1.01 or more persons per room ¹	
	1970 ²	1960 ³	1970	1960
Total.....	7.5	19.8	5.9	8.0
Metropolitan residence.....	5.0	14.1	7.3	10.4
Inside central cities.....	4.9	12.7	6.8	9.5
Outside central cities.....	5.1	17.1	8.4	12.3
Nonmetropolitan residence.....	8.8	22.6	5.1	6.8

¹Percent of all occupied units.

²Percent of all year-round housing units.

³Percent of all housing units.

Standard Metropolitan Statistical Areas

The suburban areas in the State experienced greater growth in housing than did the central cities. Housing units in the suburbs increased by 20,100 units, or 22 percent, while housing in the central cities increased by 17,900, or 9 percent. By 1970, there were 112,600 housing units in the suburbs and 216,300 in the central cities.

In 1970, about 76 percent of the housing units in the State's metropolitan areas consisted of one-unit structures. The proportion of single-family units was 72 percent in the central cities and 83 percent in the suburbs.

In 1970, 16,400 housing units in metropolitan areas, or 5 percent, of all year-round units, lacked some or all plumbing facilities. The proportion of such units in the central cities and the suburbs was the same, 5 percent. Approximately 500, or 7 percent, of the Negro households in central cities occupied units which lacked some or all plumbing facilities in 1970, compared with 70, or 18 percent, of Negro households in suburban areas.

Of all occupied units in metropolitan areas, 22,900, or 7 percent, reported more than one person per room in 1970, compared with 10 percent in 1960. In 1970, the proportion of such units was 7 percent in the central cities and 8 percent in the suburban areas (table D).

Homeownership in 1970 was greater in the suburban areas than in the central cities. About 77 percent of occupied units in the suburbs and 68 percent in the central cities were owner-occupied. The Negro homeownership rate was 69 percent in the suburbs, and 56 percent in the central cities.

Median value of owner-occupied housing in the central cities was \$16,100, compared with \$17,000 in the suburbs. About 29 percent of owned homes in the central cities were valued at \$20,000 or more, compared with 36 percent in the suburban areas. Median contract rent in the central cities and the suburbs was \$91 and \$92, respectively. In the central cities 26 percent of renter-occupied units and in the suburban areas 30 percent of such units rented for \$120 or more.

The homeowner vacancy rate for the metropolitan areas decreased slightly during the decade, from 1.2 to 1.1 percent. The rental vacancy rate increased from 5.9 to 8.5.

Annexations

Annexations occurred in each of the central cities of Iowa except Sioux City during the decade (see "Population Trends" and text table B). Such annexations affect changes in the characteristics for these central cities and their suburbs.

DEFINITIONS, EXPLANATIONS, AND SOURCES OF DATA FOLLOW THE TABLES.

CORRECTION NOTE

The corrected 1970 State figure for population is 2,826,041 and for housing is 964,125. Detailed distributions shown in this report have not been revised to reflect these corrections, because the errors were discovered after the tabulations were completed. Further information will be provided in the PC(1)-B and HC(1)-A final reports for this State.

For additional information on SMSA's which cross State lines, see PHC(2)-15 for Illinois and PHC(2)-29 for Nebraska.

Appendix

DEFINITIONS AND EXPLANATIONS

General

PERCENTS, MEDIANs, AND SYMBOLS

Percents which round to less than 0.1 are treated as zero. A dash “-” is the symbol used to signify zero. Three dots “...” indicate that the data are being withheld to avoid disclosure of information, that the base for a median or rate is too small for it to be shown, or that the data were not comparable. A minus sign preceding a figure denotes decrease. The symbol “NA” means not available.

Medians are presented in the housing table of this report for several characteristics. Medians for rooms and persons are rounded to the nearest tenth, for value to the nearest hundred dollars, and for contract rent to the nearest dollar. The median is not shown if there are fewer than five housing units in the distribution. Similarly, population per housing unit is not shown if the base for this rate is less than five units.

USUAL PLACE OF RESIDENCE

In accordance with census practice dating back to 1790, each person enumerated in the 1970 census was counted as an inhabitant of his usual place of residence, which is generally construed to mean the place where he lives and sleeps most of the time. This place is not necessarily the same as his legal residence, voting residence, or domicile. In the vast majority of cases, however, the use of these different bases of classification would produce substantially the same statistics, although there may be appreciable differences for a few areas.

The implementation of this practice has resulted in the establishing of residence rules for certain categories of persons whose usual place of residence is not immediately clear. Furthermore, this practice means that persons were not always counted as residents of the place where they happened to be found by the census enumerators. Persons without a usual place of residence were, however, counted where they were enumerated.

As in every previous census, members of the Armed Forces living on military installations were counted as residents of the area in which the installation was located. Similarly, members of the Armed Forces not living on a military installation were counted as residents of the area in which they were living. Crews of U.S. Navy vessels were counted as residents of the home port to which the particular vessel was assigned; crews of vessels deployed to the overseas fleet were therefore not included in the population of any State or the District of

Columbia. Persons in Armed Forces families were counted where they were living on Census Day (e.g., the military installation, “offbase,” or elsewhere, as the case might be).

Crews of U.S. merchant marine vessels were counted as part of the population of the U.S. port in which their vessel was berthed on Census Day; or if sailing in inland or coastal waters, either the port of departure or destination, depending on which the vessel was nearest on Census Day. Crews of all other U.S. merchant marine vessels are not included in the population of any State or the District of Columbia.

College students, as in 1950 and 1960, were counted as residents of the area in which they were living while attending college. Inmates of institutions, who ordinarily live there for considerable periods of time, were counted as residents of the area where this institution was located; on the other hand, patients in general hospitals, who ordinarily remain for short periods of time, were counted at their homes. On the night of April 6, 1970, a special enumeration was performed in missions, flop-houses, detention centers, etc., and persons enumerated therein were counted as residents of the particular place.

Americans who were overseas for an extended period (in the Armed Forces, working at civilian jobs, studying in foreign universities, etc.) are not included in the population of any of the States or the District of Columbia. On the other hand, persons temporarily abroad on vacations, business trips, and the like, were counted at their usual residence.

Persons in larger hotels, motels, etc., on the night of March 31, 1970, were requested to fill out a census form for allocation back to their homes if they indicated no one was there to report them in the census. A similar approach was used for persons visiting in private residences, as well as for Americans who left the United States during March 1970 via major intercontinental air or ship carriers for temporary travel abroad.

In addition, information on persons away from their usual place of residence was obtained from other members of their families, landladies, etc. If an entire family was expected to be away during the whole period of the enumeration, information on it was obtained from neighbors. A matching process was used to eliminate duplicate reports for a person who reported for himself while away from his usual residence and who was also reported at his usual residence by someone else.

BOUNDARIES

The data shown for 1970 relate to the boundaries of the areas as existed on January 1, 1970. As nearly as

possible, 1960 data for the same areas have been adjusted to conform to the 1970 definitions. However, it was not feasible to compile 1960 information for small pieces of territory transferred from one jurisdiction to another as a result of county and city boundary changes. Where such discrepancies exist note is made in table footnotes. "Extended cities" constitute a special boundary problem discussed below.

COUNTIES

The primary divisions of the States are, in general, termed counties, but in Louisiana these divisions are known as parishes. There are no counties in Alaska. In this State, data are shown for statistical areas which are county equivalents designated as census divisions; they were developed for general statistical purposes through the cooperation of the State and the Census Bureau. In four States (Maryland, Missouri, Nevada, and Virginia), there are one or more cities which are independent of any county organization and thus constitute primary divisions of their States.

STANDARD METROPOLITAN STATISTICAL AREAS

In this report statistics are shown for standard metropolitan statistical areas (SMSA's) except in some tables for New England States where the metropolitan State economic area or nearest equivalent whole county is substituted for the SMSA.

The population living in SMSA's is designated as the metropolitan population. This population is subdivided as "inside central city or cities" and "outside central city or cities." The latter area is frequently referred to in the text of this report as "suburbs" or "suburban ring." The population living outside SMSA's constitutes the non-metropolitan population.

The Bureau of the Census recognizes approximately 250 standard metropolitan statistical areas in the 1970 census. This number includes the 231 SMSA's (including three in Puerto Rico which are not covered in this series) as defined and named in the Bureau of the Budget publication, *Standard Metropolitan Statistical Areas: 1967*, U.S. Government Printing Office, Washington, D.C. 20402. Also included are two SMSA's as defined by the Bureau of the Budget in January 1968: Biloxi-Gulfport, Miss. and Vineland-Millville-Bridgeton, N.J. In addition, a number of SMSA's are being defined on the basis of the results from the 1970 Census.

Except in New England States, a standard metropolitan statistical area is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are socially and economically integrated with the central city. In a few cities where portions of

counties outside the SMSA as defined in 1967 were annexed to the central city, the population living in those counties is not considered part of the central city. In the New England States, SMSA's consist of towns and cities instead of counties. Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. For the complete description of the criteria used in defining SMSA's, see the Bureau of the Budget publication cited above.

STATE ECONOMIC AREAS

For the New England metropolitan areas represented in some of the tables of these reports, the SMSA has been replaced by the metropolitan State economic area (SEA) (see U.S. Census of Population, 1960, *State Economic Areas*, PC(3)1A.) Where a metropolitan SEA has not been defined, the nearest equivalent county has been used. State summaries by metropolitan and nonmetropolitan residence will, therefore, be found to vary according to whether the information contained in the tables was available for SMSA's directly or for counties only. Population tables 2,3, and 4 contain metropolitan SEA totals, while Housing table 5 shows SMSA totals. Under both systems, figures for central cities are the same.

ANNEXATIONS

A problem of definition exists with respect to some of the central cities shown in these reports. This problem arises as a consequence of annexations of territory made by cities during the 1960-70 decade. Most often, detailed population and housing characteristics from the 1960 census could not be reproduced for the annexed areas. 1960 data shown for central cities in the tables of this report thus relate to those cities as defined at the time of that census, and 1970 data refer to cities as they were defined for the 1970 census.

To clarify the impact of annexation on population change for central cities, a text table has been prepared. It shows 1970 population in current boundaries and within 1960 boundaries for central cities which annexed population. Population change within a consistently defined area, that is, excluding the effect of annexation, can then be obtained.

Since 1960, two cities have annexed the entire county in which they were located: Jacksonville, Fla. (whose boundaries in 1970 are coterminous with Duval County) and Nashville, Tenn. (whose boundaries are now coterminous with Davidson County). Indianapolis, Ind. annexed all parts of Marion County except for Beech Grove, Lawrence, Speedway, and Southport, whose combined 1960 population amounted to 31,600 out of a county total of 698,000. For these three cities (Jacksonville, Nashville, and Indianapolis), 1960 data are presented in terms of their 1970 bound-

aries. Data from the 1960 census for Duval and Davidson Counties were substituted for Jacksonville and Nashville cities as they were defined at the time of the 1960 census. Indianapolis was also considered to be coterminous with Marion County as the effect of including the four places listed above was not great enough to require a special adjustment.

EXTENDED CITIES

A number of cities contain territory essentially rural in character. The classification of all the inhabitants and housing of such cities as urban would include in the urban category persons and housing units in areas primarily rural in character. The Census Bureau therefore established certain rules to identify such cities—which are designated as “extended cities”—and to separate each into its urban and rural portions. As a concomitant of this approach, when an extended city is the central city of an SMSA, most of the 1970 census reports show only the urban portion as the central city. In the present report, however, the entire (or “legal”) city is shown as the central city because the focus here is on comparisons with 1960, and this type of delineation was not made in 1960. The effect of annexation of these extended cities, which can be especially great, is shown in a text table, where appropriate.

STANDARD CONSOLIDATED AREAS

In view of the special importance of the metropolitan complexes around New York and Chicago, the Nation's two largest cities, several contiguous SMSA's and additional counties that do not appear to meet the formal integration criteria but do have strong interrelationships of other kinds have been combined into the New York-Northeastern New Jersey and the Chicago-Northwestern Indiana Standard Consolidated Areas, respectively. The former consists of Middlesex and Somerset Counties in New Jersey and the following SMSA's: New York, Newark, Jersey City, and Paterson-Clifton-Passaic. The latter consists of the following SMSA's: Chicago and Gary-Hammond-East Chicago.

Population

Age.—The age classification is based on the age of the person in completed years as of April 1 of the census years 1960 and 1970.

Race.—The concept of race as used by the Census Bureau does not denote clear-cut scientific definitions of biological stock. Rather it reflects self-identification by respondents. Since the 1960 and 1970 censuses obtained information on race principally through self-enumeration, the data represent essentially self-classification by people according to the race with which they identify themselves. For persons of mixed parentage who are in doubt as to their classification, the race of the person's father is used. Persons of Mexican or Puerto Rican birth

or ancestry who do not identify themselves as of a race other than white (e.g., American Indian, Negro, etc.) are classified as white. In the three-category grouping shown in this report, the “other” category consists of all races except white or Negro, i.e., American Indian, Japanese, Chinese, Filipino, Korean, Eskimo, etc.

1970 age-race data taken from the published PC(V2) Series of Advance Population Reports were available for two major population groups: “Total” and “Negro”. In presenting comparable age-race statistics for SMSA's and their component parts in the present series of reports, however, race is classified as “white” and “Negro and other races.” This is the classification employed in the 1960 census, except that “nonwhite” was the term used for “Negro and other races.” It has been kept in two tables of this series (tables 3 and 4) either because of the difficulty or inadvisability of substituting “Negro” only for the broader “nonwhite” classification. As an example of one of the difficulties encountered in making this substitution, it was found that 1960 age detail by race could not be reproduced for the Negro population of counties or county substitutes, which are the building blocks of SMSA's. Unpublished 1970 age detail for “other races” was available, however, to construct a “Negro and other races” age distribution which could then be directly compared with the 1960 race classification.

A more detailed comparison of 1960 and 1970 age-race data can be made for certain of the largest cities. The 1960 age distribution of white, Negro, and other races appears in the 1960 Census volumes for all cities of 100,000 total population or more. For each such city which did not experience boundary changes between 1960 and 1970, a comparison of age detail for the three race groups can be made. A special text table has been prepared to show age distributions of “Negro” population and “Other races” where such information may be of particular interest, as for example in cities which had over 10,000 Negroes in 1960 and in cities which had approximately equal numbers of both race groupings in 1960.

Components of Change.—The components of population change shown in table 3—births, deaths, and net migration—are estimates. As such they are subject to certain limitations unlike the census counts contained in the tables of this report. The estimates are based on reported births and deaths by place of residence, 1960 through 1968, compiled and published by the Division of Vital Statistics, National Center for Health Statistics. Since no vital statistics were readily available for 1969 and the first 3 months of 1970, they were extrapolated using a factor of 1.25 times the average of years 1967-68. Births and deaths were then summed to totals for the decade. Births were corrected by color for underregistration, using factors derived from the

National Center's birth registration test of 1950. As a final step, both births and deaths were adjusted to be consistent with independent State estimates for the decade.

Vital statistics by race were not reported for counties where less than 10 percent of the total population were members of Negro and other races or which had populations of less than 10,000 belonging to these races. These counties are not included in the metropolitan-nonmetropolitan summaries for the State nor for the individual SMSA's when shown by race.

The estimate of net migration was derived as a residual by the following formula: Net Migration = Net Change - Births + Deaths. As a residual value, however, the net migration component reflects the net effect of any errors in the data used, such as differential undercount in the 1960 and 1970 censuses, boundary changes, improper allocation of births and deaths by place of residence, and many others.¹

At the county level very few significant boundary modifications are made. Many cities have annexed territory during the past decade, however, and the shifts resulting from annexation are thrown into the migration component. Special attention is given in the text to the effect of boundary changes on the net migration component for central cities.

Housing

Housing units and group quarters.—All living quarters are classified in the census as either housing units or group quarters. Usually, living quarters are in structures intended for residential use (e.g., a one-family home, apartment house, hotel or motel, boarding house, mobile home or trailer, etc.). Living quarters may also be in structures intended for nonresidential use (e.g., the rooms in a warehouse where a watchman lives), as well as in tents, caves, old railroad cars, etc.

A housing unit is a house, an apartment, a group of rooms, or a single room occupied or intended for occupancy as separate living quarters. Separate living quarters are those in which the occupants do not live and eat with any other persons in the structure and which quarters have either (1) direct access from the outside of the building or through a common hall or (2) complete kitchen facilities for the exclusive use of the occupants. The occupants may be a single family, one person living alone, two or more families living together, or any other group of related or nonrelated persons who share living arrangements (except as described in the next paragraph on group quarters). Both occupied and vacant housing units are included in the housing inven-

¹For a more detailed discussion of the types of errors which affect estimates of net migration derived in this manner, see *Current Population Reports*, Series P-23 No. 7, pages 13 and 14.

tory, except that mobile homes, trailers, tents, etc., are included only if they are occupied.

Group quarters are living arrangements for institutional inmates or for other groups containing five or more persons not related to the person in charge. Group quarters are located most frequently in institutions, boarding houses, military barracks, college dormitories, fraternity and sorority houses, hospitals, monasteries, convents, and ships. A house or apartment is considered group quarters if it is shared by the person in charge and five or more persons unrelated to him, or if there is no person in charge, by six or more unrelated persons. Information on the housing characteristics of group quarters is not collected in the census.

Year-round housing units.—In 1970, data on housing characteristics are limited to year-round housing units—all occupied units plus vacant units which are intended for year-round use—because it is difficult to obtain reliable information for the remaining types of units, i.e., units reported as vacant at the time of the census and intended for seasonal occupancy or held for migratory labor.

In 1960, housing characteristics were provided for all units, including vacant seasonal and vacant migratory units.

Occupied housing units.—A housing unit is classified as occupied if a person or group of persons is living in it at the time of enumeration or if the occupants are only temporarily absent, for example, on vacation. However, if the persons staying in the unit have their usual place of residence elsewhere, the unit is classified as vacant. A household consists of all persons who occupy a housing unit.

Population and persons.—“Population in housing units” is the total population less those persons living in group quarters. “Population per occupied unit” is computed by dividing the population living in housing units by the number of occupied housing units; this is also computed separately for the population in owner and in renter occupied units. The caption “Persons” refers to the number of persons occupying the housing unit; the data show the number of housing units occupied by the specified number of persons.

Race.—The classification by race used in the housing table refers to the race of the head of the household occupying the housing unit. Figures on tenure for 1970 are given separately for all households and for Negro heads of households; for 1960, the tenure figures relate to all households and to household heads of “Negro and other races” (excluding white heads of households). In the 1960 census, the term “nonwhite” was used for Negro and other races. Data on change (1960 to 1970) are shown only when the population data by race indicate that the number of Negro households in 1960

constituted a sufficiently large proportion of household heads of Negro and other races to permit meaningful comparison.

Tenure.—A housing unit is "owner occupied" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owner occupied" only if the owner or co-owner lives in it. All other occupied units are classified as "renter occupied," including units rented for cash rent and those occupied without payment of cash rent.

Vacant housing units.—A housing unit is vacant if no one is living in it at the time of enumeration, unless its occupants are only temporarily absent. In addition, a vacant unit may be one which is entirely occupied by persons who have a usual residence elsewhere. New units not yet occupied are enumerated as vacant housing units if construction has reached a point where all exterior windows and doors are installed and final usable floors are in place. Vacant units are excluded if unfit for human habitation because the roof, walls, windows, or doors no longer protect the interior from the elements, or if there is positive evidence (such as a sign on the house or in the block) that the unit is to be demolished or is condemned.

Vacant housing units are classified in this report as either "seasonal and migratory" (i.e., intended for seasonal occupancy or held for migratory labor) or "year-round." The latter are units which, although vacant at the time of enumeration, are usually occupied or are intended for occupancy at any time of the year. A unit in a resort area which is usually occupied on a year-round basis is considered as a year-round unit. Units used only occasionally throughout the year are also considered year-round units.

Year-round vacant units are subdivided as follows: "For sale only," and "for rent" which also includes vacant units offered either for rent or for sale. All other year-round vacant units are included in the total and may be derived by subtracting the sum of the vacant units "for sale only" and "for rent" from the total. Other year-round vacant units include units sold or rented but not yet occupied by the new owner or renter, units held for the occasional use of the owner, and units held off the market for other reasons.

Homeowner vacancy rate.—The homeowner vacancy rate in 1970 is the number of year-round vacant units for sale as a percent of the total homeowner inventory, i.e., all owner-occupied units and year-round vacant units for sale. In 1960, the homeowner vacancy rate was based on vacant units available for sale, i.e., year-round vacant units for sale in sound or deteriorating condition.

Rental vacancy rate.—The rental vacancy rate in 1970 is the number of year-round vacant units for rent as a

percent of the total rental inventory, i.e., all renter-occupied units and all year-round vacant units for rent. In 1960, the rental vacancy rate was based on vacant units available for rent, i.e., year-round vacant units for rent in sound or deteriorating condition.

Rooms.—Rooms to be counted include whole rooms used for living purposes, such as living rooms, dining rooms, kitchens, bedrooms, finished recreation rooms, family rooms, etc. Not counted as rooms are bathrooms, porches, balconies, foyers, halls, halfrooms, kitchenettes, strip or pullman kitchens, utility rooms, unfinished attics, basements, or other space used for storage.

Data on change (1960 to 1970) are not given when the number of vacant seasonal and migratory units that are excluded from the 1970 tabulations is too large to produce meaningful comparisons.

Persons per room.—This is computed by dividing the number of persons in the unit by the number of rooms in the unit. The figures shown refer, therefore, to the number of housing units having the specified ratio of persons per room.

Units in structure.—Statistics on the number of housing units in a structure are presented in terms of one-family houses, number of units in multiunit structures, and mobile homes or trailers.

Data on change (1960 to 1970) are not given when the number of vacant seasonal and migratory units that are excluded from the 1970 tabulations is too large to produce meaningful comparisons.

Plumbing facilities.—The category "with all plumbing facilities" consists of units which have hot and cold piped water, as well as a flush toilet and a bathtub or shower inside the structure for the exclusive use of the occupants of the unit. "Lacking some or all plumbing" means that the unit does not have all three specified plumbing facilities (hot and cold piped water, as well as flush toilet and bathtub or shower inside the structure), or that the toilet or bathing facilities are also for the use of the occupants of other housing units.

For 1960, data on plumbing facilities were derived from information on number of bathrooms. Data for units with all plumbing facilities and with 1.01 or more persons per room are not available from the 1960 reports. Similarly, 1960 data on plumbing facilities are not available by race.

Data on change (1960 to 1970) are not given when the number of vacant seasonal and migratory units that are excluded from the 1970 tabulations is too large to produce meaningful comparisons.

Value.—Value is the respondent's estimate of how much the property (house and lot) would sell for if it were for sale. The term "specified owner occupied" means that in 1970 the value data are limited to owner occupied, one-family houses on less than ten acres, without a

commercial establishment or medical office on the property. Owner occupied cooperatives, condominiums, mobile homes, and trailers are excluded from the value tabulations.

In 1960 in rural territory, units on farms and all units on places of 10 or more acres (whether farm or nonfarm) were excluded from the value tabulations. In 1970, all units on 10 or more acres are excluded, urban as well as rural; consequently the 1970 value tabulations include farm units of less than 10 acres and exclude units in urban areas on 10 or more acres.

Contract rent.—Contract rent is the monthly rent agreed to or contracted for, even if the furnishings, utilities, or services are included. The term "specified renter occupied" means that in 1970 the contract rent data exclude one-family houses on ten acres or more. Renter units occupied without payment of cash rent are shown separately as "no cash rent" in the rent tabulations.

The 1960 rent tabulations excluded farm units and vacant units on 10 or more acres in rural areas. In 1970, all one-family houses on 10 or more acres, whether occupied or vacant and whether urban or rural, are excluded from the rent tabulations.

SOURCES OF DATA

The basic 1970 population and housing data contained in the statistical tables of this series were obtained from

the Advance Reports on Population, PC(V1) and PC(V2), and Housing, HC(V1), issued by the Bureau of the Census for individual States. Certain data on characteristics from those reports are subject to change in the 1970 census PC(1)-B Final Reports on Population and HC(1)-A Final Reports on Housing being issued for States during the spring and summer of 1971.

The PHC(2) Series also contains parallel statistics for 1960, available from published Census sources. 1960 statistics referring to SMSA's have been adjusted to conform to 1970 area definitions. Population and housing characteristics of SMSA's formed during the decade have been reconstructed as of 1960 to complete the comparison with 1970 areas. The source of information regarding criteria for establishment of new SMSA's as well as intercensal adjustments in SMSA boundaries is the Bureau of the Budget publication, *Standard Metropolitan Statistical Areas: 1967*, U.S. Government Printing Office, Washington, D.C. 20402.

Publications of the National Center for Health Statistics were used to develop components of population change. In some cases, supplementary vital statistics were obtained from State health departments.

Some unpublished data from the 1960 Census of Housing were utilized. For those SMSA's which underwent boundary changes from 1960 to 1970, it was necessary to develop a tabulated reprint of 1960 contract rent data on a county basis.

PHC(2)-18

KANSAS

FINAL REPORT

General Demographic Trends for Metropolitan Areas, 1960 to 1970

(This series consists of 52 reports—number 1 for the United States and numbers 2 thru 52 for the States and the District of Columbia in alphabetical order rather than order of publication.)

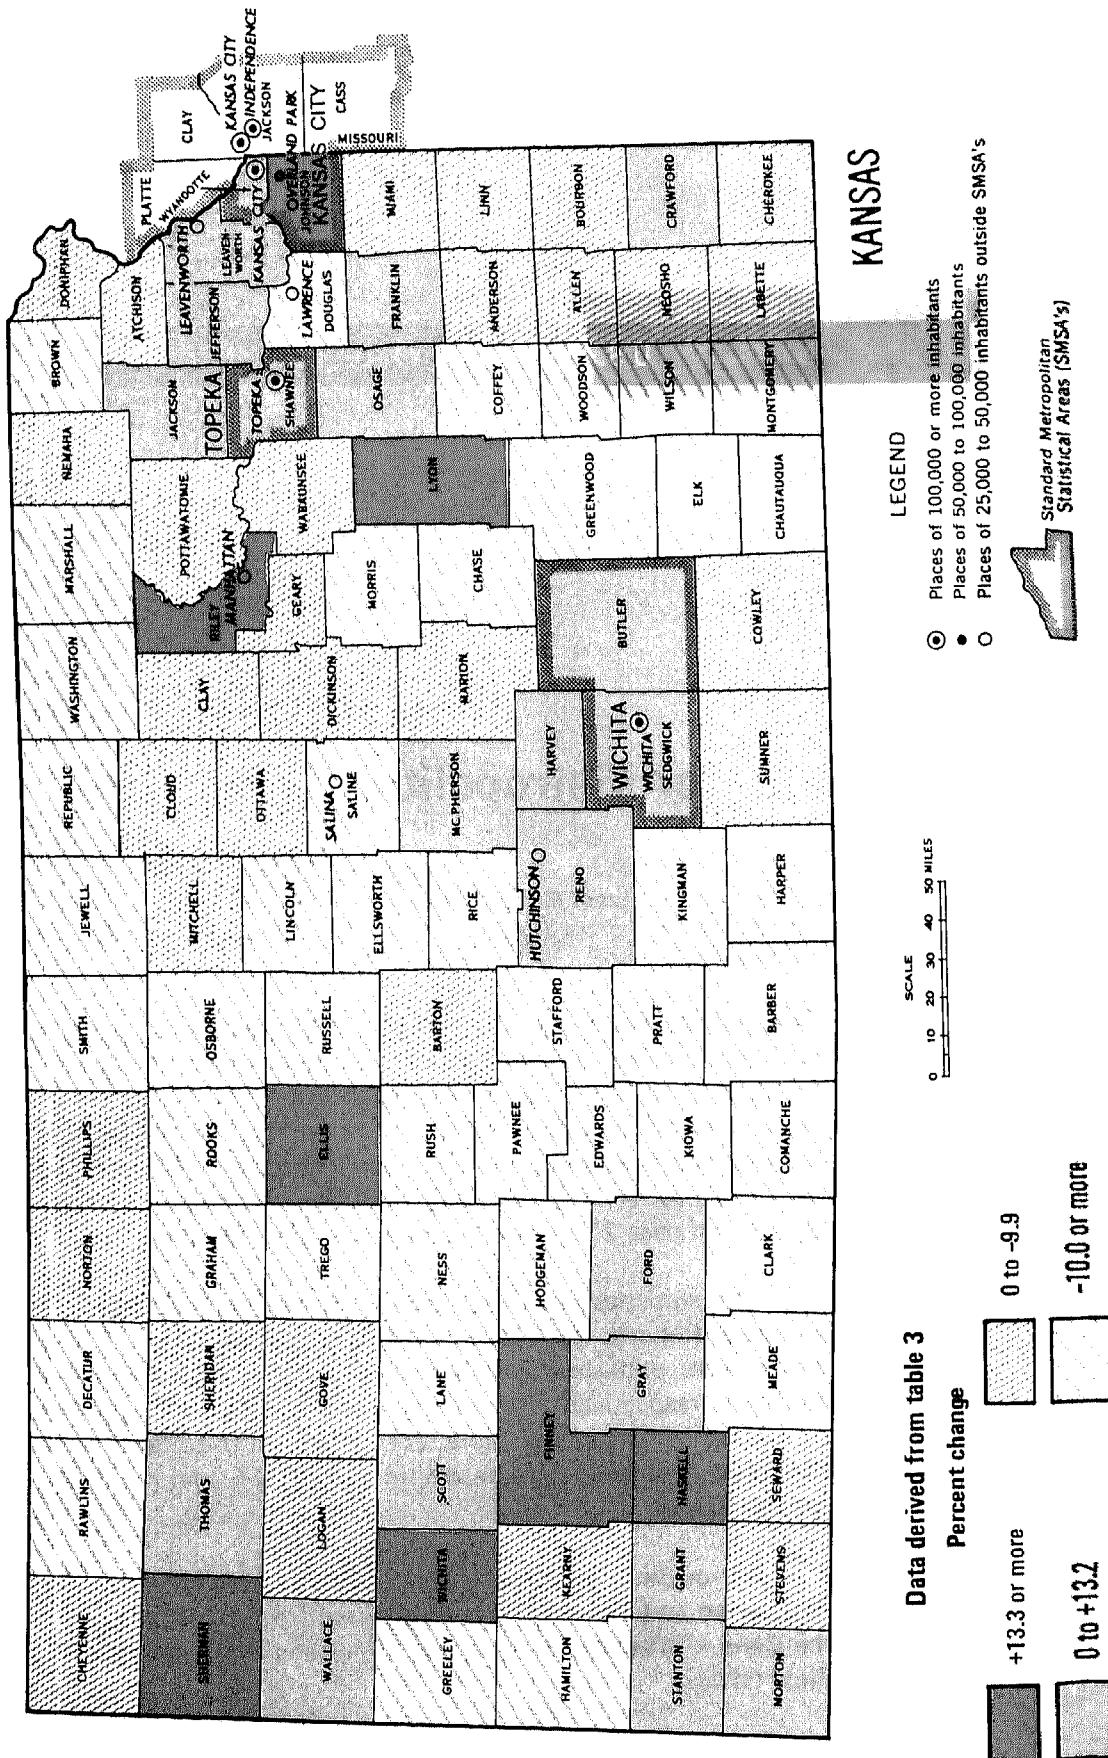

This publication is one of a series of 1970 census reports concerned mainly with population and housing trends in metropolitan areas from 1960 to 1970. The main body of the report consists of an analytical text, a statistical section containing four tables on population characteristics and one on housing characteristics, and an appendix presenting technical definitions and explanations. A map showing 1960-70 population change by county appears on page 2 and a detailed table of contents is on page 3.

The statistics presented here are drawn largely from the 1970 census Advance Reports PC(V2) and HC(V1) for this State. These two reports, which were published several months ago, provide population and housing statistics, respectively, for each standard metropolitan statistical area, place of 10,000 inhabitants or more, and county in the State. Additional data on the subjects covered here appear in the PC(1)-B and HC(1)-A Final Reports for this State.

An outline of the publication program for the 1970 Census of Population and Housing can be obtained free of charge from the Bureau of the Census, Washington, D.C. 20233, or any U.S. Department of Commerce Field Office.

Population Change for Counties: 1960 to 1970

2

Analytical Text

POPULATION TRENDS

General

Between 1960 and 1970 the total population of Kansas grew by only 68,000 persons, from 2,179,000 to 2,247,000, an increase of 3 percent over the population living in the State in 1960 (table A). This growth resulted from an increase of 97,000 in metropolitan areas and a decline of 29,000 in nonmetropolitan areas. Within metropolitan areas, central cities had an increase in population of 27,000, or 7 percent, while the areas outside central cities grew twice as fast, by 70,000 persons, or nearly 15 percent.

Over the decade, the metropolitan population of Kansas increased as a proportion of total population, from 39 percent in 1960 to 42 percent in 1970. In the Nation as a whole, nearly 70 percent of the population is metropolitan.

The total number of households in Kansas in 1970 was 727,000, or 54,000 more than in 1960. The

population living in households increased more slowly than the rate at which households increased, with the result that average household size declined from 3.2 to 3.0 persons.

At the time of the 1960 and 1970 Censuses, the population of Kansas was about 95 percent white. Whites constitute 92 percent of the population in metropolitan areas and 97 percent in nonmetropolitan areas.

The growth of the State and metropolitan area populations was produced by natural increase (the excess of births over deaths) which more than offset their net outmigration (see Table 3). This was not true of the nonmetropolitan areas where a substantial net outmigration more than offset the natural increase.

The State's white population grew slowly over the decade, by only 2 percent. The substantial natural increase of this group (182,000) was cut back sharply by a net outmigration of 139,000 persons, equivalent to 7 percent of the white population of Kansas in 1960. The population of other races, by contrast, grew very

Table A. Population by Race and Metropolitan and Nonmetropolitan Residence: 1970 and 1960

The State Metropolitan and Non- metropolitan Residence	Population		Change		Percent Distribution

	1,256,139	1,291,368	-35,229	-2.7	55.9	59.3
Negro and other races	124,510	99,945	24,565	24.6	5.5	4.6
Metropolitan residence...						
Inside central cities..	83,252	64,901	18,351	28.3	3.7	3.0
Outside central cities.	41,560	30,956	10,604	34.3	1.8	1.4
Nonmetropolitan residence	41,692	33,945	7,747	22.8	1.9	1.6
	41,258	35,044	6,214	17.7	1.8	1.6

rapidly, by 25 percent over the decade, as a result of both natural increase (19,000) and net immigration (6,000).

All areas of the State experienced significant changes in age composition. In metropolitan areas there were declines in the number of persons under 5 and 25 to 44 years of age. All other age groups increased, notably 15-24 year olds, which grew by 54 percent. In non-metropolitan areas, which suffered an overall loss, every age group was diminished except the young adult group, 15-24, which grew by 32 percent, and the elderly population 65 and over, which increased by 6 percent.

These changes are due in part to changing birth rates and in part to migration, which is highly selective by age. Low birth rates during the depression years and in the 1960's contribute to the diminution of age groups 25-44 and under 5 years, whereas the post-World War II "baby boom" is currently reflected in the large size of the population 15-24 years old.

Standard Metropolitan Statistical Areas

The two standard metropolitan statistical areas (SMSA's) entirely within Kansas are Wichita and Topeka. About one-third of the Kansas City, Mo.-Kans. SMSA is in Kansas also. The Wichita SMSA (consisting of Butler and Sedgwick Counties) had a population of 389,000 in 1970, up from 382,000 in 1960. This small increase, of only 2 percent, reflects substantial net outmigration. The central city of Wichita in Sedgwick County shows a population increase of 9 percent. This gain was produced by annexation of a suburban population of 39,000. Without it, Wichita city would have shown a population loss (table B). The SMSA carries out service functions for its market area in Kansas and Oklahoma. It also specializes in mining and aircraft production activities.

The Topeka SMSA (consisting of Shawnee County) had a population of 155,000 in 1970 and 141,000 in 1960, an increase of 10 percent. The city of Topeka

shows a 5 percent increase in population, in part as a result of annexation. In addition to being the capital of Kansas, Topeka is also a financial and transportation center for Northeast Kansas. Reductions in the military installation in Shawnee County contributed to the metropolitan area's below average growth rate.

The Kansas portion of the Kansas City, Mo.-Kans. SMSA, which is made up of Johnson and Wyandotte Counties, contains a larger population than either the Topeka or Wichita SMSA's. Between 1960 and 1970 the population of these two counties increased from 329,000 to 405,000, by 23 percent. In 1970, this population comprised 43 percent of the total metropolitan population of the State.

Counties

Between 1960 and 1970 only 30 of the 105 counties in Kansas increased in population. These were largely located in the eastern half of the State (see map). Eight of these counties had percentage increases above the 13.3 percent national average. Those with the largest gains were: Johnson (a part of the Kansas City SMSA) with 51 percent; Riley (site of a military installation and college) with 36 percent; Douglas (site of the University of Kansas and adjoins Memphis SMSA) with 33 percent; Haskell with 23 percent; and Lyon (site of a college) with 19 percent. Among the fast growing counties, the fastest growing, Johnson, had the second largest population (218,000) in 1970. Next in size was Riley with 57,000. The remaining counties were substantially lower in population size.

Nineteen counties had an excess of deaths over births. The natural decrease in population combined with net outmigration resulted in a population loss for these counties over the decade. These counties are located in the north central and southeastern parts of the State. The proportion of the population over 65 in these counties ranged from 19 to 26 percent, significantly higher percentages than the State average of 12.

Table B. Change in Population of Central Cities Through Annexation: 1960 to 1970

Central Cities	1970 population			Change 1960 to 1970 in 1960 area	
	Total	In 1960 annexed area	In 1960 area	1960 population	
Kansas City.....	168,213	104,288	63,925	121,901	-17,613
Wichita.....	276,554	237,372	39,182	254,698	-17,326
Topeka.....	125,011	121,100	3,831	119,484	1,696

In the remaining 86 counties, net outmigration was sufficient in all but 17 cases to wipe out the gains contributed by natural increase. Only three counties had substantial net inmigration and these were the fastest growing counties mentioned above, i.e., Johnson, Douglas, and Riley.

Only four counties in Kansas contain a large enough population of races other than white to have this group shown separately in the table of county components of change (see "Definitions and Explanations"). In one county Geary, the population remained stable as net outmigration offset the natural increase. The three metropolitan counties of Sedgwick, Shawnee and Wyandotte had rapidly growing Negro populations. In Sedgwick, a very substantial natural increase and a small net inmigration produced a growth of 41 percent in the population of races other than white. This population in Shawnee County increased by 25 percent and in Wyandotte County by 19 percent.

HOUSING TRENDS

General

Between 1960 and 1970, the total supply of housing units in Kansas increased more rapidly than population. The population grew by 68,000, or 3 percent, while housing units increased by 48,900, or 7 percent (table C).

The metropolitan areas of the State experienced greater relative growth in housing than did the nonmetropolitan part, while population increased in metropolitan areas and declined in nonmetropolitan areas. The number of housing units in metropolitan areas rose from 275,300 to 317,400 over the decade, an increase of 42,100 units, or 15 percent; this compares with an

increase of 6,800 units, or 1 percent, in the nonmetropolitan areas. While 40 percent of all housing units were in the metropolitan areas, these areas accounted for 86 percent of the total State increase between 1960 and 1970.

About 82 percent of the housing in Kansas consisted of one-unit structures in 1970. The number of units in multiunit structures, however, increased 45.6 percent during the decade while the number of one-unit structures declined 0.4 percent.

The number of units in the State lacking some or all plumbing facilities declined from 117,500 to 43,900, a 63-percent decrease since 1960. In 1970, the proportion of such units was 3 percent in metropolitan areas and 8 percent in nonmetropolitan areas.

Approximately 1,700, or 6 percent, of the Negro-occupied units in the State lacked some or all plumbing in 1970. The corresponding proportions for inside and outside the metropolitan areas were 5 percent and 9 percent, respectively.

Households were smaller in 1970 than in 1960. In the metropolitan areas, average household size declined from 3.3 persons in 1960 to 3.1 in 1970 and in nonmetropolitan areas, from 3.1 persons to 2.9. The number of one- and two-person households in metropolitan areas increased by 61 percent and 26 percent, respectively; in nonmetropolitan areas one- and two-person households increased 34 percent and 8 percent, respectively. The number of households with five or more persons increased 2 percent in metropolitan areas and declined 12 percent in nonmetropolitan areas.

The median number of rooms rose from 4.9 to 5.1 in metropolitan areas and remained unchanged at 5.1 in nonmetropolitan areas. Units with one to three rooms declined in both metropolitan and nonmetropolitan areas, while units with seven or more rooms increased 65.5 percent in metropolitan areas and declined 0.1 percent in nonmetropolitan areas.

Table C. Housing Units by Metropolitan and Nonmetropolitan Residence: 1970 and 1960

The State Metropolitan and Nonmetropolitan Residence	Housing units				Popula- tion percent change	
	Total		Change			
	1970	1960	Number	Percent		
Total.....	789,196	740,335	48,861	6.6	3.1	
Metropolitan residence.....	317,397	275,305	42,091	15.3	11.4	
Inside central cities....	143,620	128,426	15,194	11.8	7.3	
Outside central cities...	173,776	146,879	26,897	18.3	14.6	
Nonmetropolitan residence..	471,800	465,030	6,770	1.5	-2.2	

increased from 4.9 to 5.1. In 1970, the median number of rooms in the central cities was 4.9 and in the suburbs, 5.3.

Of all occupied units in metropolitan areas, 19,500, or 6 percent, reported more than one person per room in 1970, compared with 11 percent in 1960. In 1970, the proportion of such units was 6 percent in the central cities and 7 percent in the suburban areas (table D).

Homeownership in 1970 was greater in the suburban areas than in the central cities. About 72 percent of occupied units in the suburbs and 62 percent in the central cities were owner-occupied. The Negro homeownership rate in the suburbs was 58 percent, compared with 50 percent in the central cities.

Median value in the central cities was \$13,800 compared with \$16,300 in the suburbs. About 22

percent of the owner-occupied housing in the central cities was valued at \$20,000 or more compared with 35 percent in the suburbs. Median contract rent in the central cities and the suburbs was \$85 and \$95, respectively. In the central cities 33 percent of renter-occupied units rented for \$100 or more, compared with 46 percent in the suburbs.

The homeowner vacancy rate for metropolitan areas decreased during the decade from 2.2 to 1.3 percent. The rental vacancy rate decreased from 11.7 to 9.1.

Annexations

Annexations occurred in each of the central cities during the decade (see "Population Trends" and text table B). Such annexations affect changes in the characteristics for these central cities and their suburbs.

DEFINITIONS, EXPLANATIONS, AND SOURCES OF DATA FOLLOW THE TABLES.

CORRECTION NOTE

The corrected 1970 State figure for population is 2,249,071 and for housing is 789,735. Detailed distributions shown in this report have not been revised to reflect these corrections, because the errors were discovered after the tabulations were completed. Further information will be provided in the PC(1)-B and HC(1)-A final reports for this State.

For additional information on SMSA's which cross State lines, see PHC(2)-27 for Missouri.

Appendix

DEFINITIONS AND EXPLANATIONS

General

PERCENTS, MEDIANs, AND SYMBOLS

Percents which round to less than 0.1 are treated as zero. A dash “-” is the symbol used to signify zero. Three dots “...” indicate that the data are being withheld to avoid disclosure of information, that the base for a median or rate is too small for it to be shown, or that the data were not comparable. A minus sign preceding a figure denotes decrease. The symbol “NA” means not available.

Medians are presented in the housing table of this report for several characteristics. Medians for rooms and persons are rounded to the nearest tenth, for value to the nearest hundred dollars, and for contract rent to the nearest dollar. The median is not shown if there are fewer than five housing units in the distribution. Similarly, population per housing unit is not shown if the base for this rate is less than five units.

USUAL PLACE OF RESIDENCE

In accordance with census practice dating back to 1790, each person enumerated in the 1970 census was counted as an inhabitant of his usual place of residence, which is generally construed to mean the place where he lives and sleeps most of the time. This place is not necessarily the same as his legal residence, voting residence, or domicile. In the vast majority of cases, however, the use of these different bases of classification would produce substantially the same statistics, although there may be appreciable differences for a few areas.

The implementation of this practice has resulted in the establishing of residence rules for certain categories of persons whose usual place of residence is not immediately clear. Furthermore, this practice means that persons were not always counted as residents of the place where they happened to be found by the census enumerators. Persons without a usual place of residence were, however, counted where they were enumerated.

As in every previous census, members of the Armed Forces living on military installations were counted as residents of the area in which the installation was located. Similarly, members of the Armed Forces not living on a military installation were counted as residents of the area in which they were living. Crews of U.S. Navy vessels were counted as residents of the home port to which the particular vessel was assigned; crews of vessels deployed to the overseas fleet were therefore not included in the population of any State or the District of

Columbia. Persons in Armed Forces families were counted where they were living on Census Day (e.g., the military installation, “offbase,” or elsewhere, as the case might be).

Crews of U.S. merchant marine vessels were counted as part of the population of the U.S. port in which their vessel was berthed on Census Day; or if sailing in inland or coastal waters, either the port of departure or destination, depending on which the vessel was nearest on Census Day. Crews of all other U.S. merchant marine vessels are not included in the population of any State or the District of Columbia.

College students, as in 1950 and 1960, were counted as residents of the area in which they were living while attending college. Inmates of institutions, who ordinarily live there for considerable periods of time, were counted as residents of the area where this institution was located; on the other hand, patients in general hospitals, who ordinarily remain for short periods of time, were counted at their homes. On the night of April 6, 1970, a special enumeration was performed in missions, flop houses, detention centers, etc., and persons enumerated therein were counted as residents of the particular place.

Americans who were overseas for an extended period (in the Armed Forces, working at civilian jobs, studying in foreign universities, etc.) are not included in the population of any of the States or the District of Columbia. On the other hand, persons temporarily abroad on vacations, business trips, and the like, were counted at their usual residence.

Persons in larger hotels, motels, etc., on the night of March 31, 1970, were requested to fill out a census form for allocation back to their homes if they indicated one was there to report them in the census. A similar approach was used for persons visiting in private residences, as well as for Americans who left the United States during March 1970 via major intercontinental air or ship carriers for temporary travel abroad.

In addition, information on persons away from their usual place of residence was obtained from other members of their families, landladies, etc. If an entire family was expected to be away during the whole period of the enumeration, information on it was obtained from neighbors. A matching process was used to eliminate duplicate reports for a person who reported for himself while away from his usual residence and who was also reported at his usual residence by someone else.

BOUNDARIES

The data shown for 1970 relate to the boundaries of areas as existed on January 1, 1970. As nearly

possible, 1960 data for the same areas have been adjusted to conform to the 1970 definitions. However, it was not feasible to compile 1960 information for small pieces of territory transferred from one jurisdiction to another as a result of county and city boundary changes. Where such discrepancies exist note is made in table footnotes. "Extended cities" constitute a special boundary problem discussed below.

COUNTIES

The primary divisions of the States are, in general, termed counties, but in Louisiana these divisions are known as parishes. There are no counties in Alaska. In this State, data are shown for statistical areas which are county equivalents designated as census divisions; they were developed for general statistical purposes through the cooperation of the State and the Census Bureau. In four States (Maryland, Missouri, Nevada, and Virginia), there are one or more cities which are independent of any county organization and thus constitute primary divisions of their States.

STANDARD METROPOLITAN STATISTICAL AREAS

In this report statistics are shown for standard metropolitan statistical areas (SMSA's) except in some tables for New England States where the metropolitan State economic area or nearest equivalent whole county is substituted for the SMSA.

The population living in SMSA's is designated as the metropolitan population. This population is subdivided as "inside central city or cities" and "outside central city or cities." The latter area is frequently referred to in the text of this report as "suburbs" or "suburban ring." The population living outside SMSA's constitutes the non-metropolitan population.

The Bureau of the Census recognizes approximately 250 standard metropolitan statistical areas in the 1970 census. This number includes the 231 SMSA's (including three in Puerto Rico which are not covered in this series) as defined and named in the Bureau of the Budget publication, *Standard Metropolitan Statistical Areas: 1967*, U.S. Government Printing Office, Washington, D.C. 20402. Also included are two SMSA's as defined by the Bureau of the Budget in January 1968: Biloxi-Gulfport, Miss. and Vineland-Millville-Bridgeton, N.J. In addition, a number of SMSA's are being defined on the basis of the results from the 1970 Census.

Except in New England States, a standard metropolitan statistical area is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are socially and economically integrated with the central city. In a few cities where portions of

counties outside the SMSA as defined in 1967 were annexed to the central city, the population living in those counties is not considered part of the central city. In the New England States, SMSA's consist of towns and cities instead of counties. Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. For the complete description of the criteria used in defining SMSA's, see the Bureau of the Budget publication cited above.

STATE ECONOMIC AREAS

For the New England metropolitan areas represented in some of the tables of these reports, the SMSA has been replaced by the metropolitan State economic area (SEA) (see U.S. Census of Population, 1960, *State Economic Areas, PC(3)1A.*) Where a metropolitan SEA has not been defined, the nearest equivalent county has been used. State summaries by metropolitan and nonmetropolitan residence will, therefore, be found to vary according to whether the information contained in the tables was available for SMSA's directly or for counties only. Population tables 2, 3, and 4 contain metropolitan SEA totals, while Housing table 5 shows SMSA totals. Under both systems, figures for central cities are the same.

ANNEXATIONS

A problem of definition exists with respect to some of the central cities shown in these reports. This problem arises as a consequence of annexations of territory made by cities during the 1960-70 decade. Most often, detailed population and housing characteristics from the 1960 census could not be reproduced for the annexed areas. 1960 data shown for central cities in the tables of this report thus relate to those cities as defined at the time of that census, and 1970 data refer to cities as they were defined for the 1970 census.

To clarify the impact of annexation on population change for central cities, a text table has been prepared. It shows 1970 population in current boundaries and within 1960 boundaries for central cities which annexed population. Population change within a consistently defined area, that is, excluding the effect of annexation, can then be obtained.

Since 1960, two cities have annexed the entire county in which they were located: Jacksonville, Fla. (whose boundaries in 1970 are coterminous with Duval County) and Nashville, Tenn. (whose boundaries are now coterminous with Davidson County). Indianapolis, Ind. annexed all parts of Marion County except for Beech Grove, Lawrence, Speedway, and Southport, whose combined 1960 population amounted to 31,600 out of a county total of 698,000. For these three cities (Jacksonville, Nashville, and Indianapolis), 1960 data are presented in terms of their 1970 bound-

aries. Data from the 1960 census for Duval and Davidson Counties were substituted for Jacksonville and Nashville cities as they were defined at the time of the 1960 census. Indianapolis was also considered to be coterminous with Marion County as the effect of including the four places listed above was not great enough to require a special adjustment.

EXTENDED CITIES

A number of cities contain territory essentially rural in character. The classification of all the inhabitants and housing of such cities as urban would include in the urban category persons and housing units in areas primarily rural in character. The Census Bureau therefore established certain rules to identify such cities—which are designated as “extended cities”—and to separate each into its urban and rural portions. As a concomitant of this approach, when an extended city is the central city of an SMSA, most of the 1970 census reports show only the urban portion as the central city. In the present report, however, the entire (or “legal”) city is shown as the central city because the focus here is on comparisons with 1960, and this type of delineation was not made in 1960. The effect of annexation of these extended cities, which can be especially great, is shown in a text table, where appropriate.

STANDARD CONSOLIDATED AREAS

In view of the special importance of the metropolitan complexes around New York and Chicago, the Nation's two largest cities, several contiguous SMSA's and additional counties that do not appear to meet the formal integration criteria but do have strong interrelationships of other kinds have been combined into the New York-Northeastern New Jersey and the Chicago-Northwestern Indiana Standard Consolidated Areas, respectively. The former consists of Middlesex and Somerset Counties in New Jersey and the following SMSA's: New York, Newark, Jersey City, and Paterson-Clifton-Passaic. The latter consists of the following SMSA's: Chicago and Gary-Hammond-East Chicago.

Population

Age.—The age classification is based on the age of the person in completed years as of April 1 of the census years 1960 and 1970.

Race.—The concept of race as used by the Census Bureau does not denote clear-cut scientific definitions of biological stock. Rather it reflects self-identification by respondents. Since the 1960 and 1970 censuses obtained information on race principally through self-enumeration, the data represent essentially self-classification by people according to the race with which they identify themselves. For persons of mixed parentage who are in doubt as to their classification, the race of the person's father is used. Persons of Mexican or Puerto Rican birth

or ancestry who do not identify themselves as of a race other than white (e.g., American Indian, Negro, etc.) are classified as white. In the three-category grouping shown in this report, the “other” category consists of all races except white or Negro, i.e., American Indian, Japanese, Chinese, Filipino, Korean, Eskimo, etc.

1970 age-race data taken from the published PC(V2) Series of Advance Population Reports were available for two major population groups: “Total” and “Negro”. In presenting comparable age-race statistics for SMSA's and their component parts in the present series of reports, however, race is classified as “white” and “Negro and other races.” This is the classification employed in the 1960 census, except that “nonwhite” was the term used for “Negro and other races.” It has been kept in two tables of this series (tables 3 and 4) either because of the difficulty or inadvisability of substituting “Negro” only for the broader “nonwhite” classification. As an example of one of the difficulties encountered in making this substitution, it was found that 1960 age detail by race could not be reproduced for the Negro population of counties or county substitutes, which are the building blocks of SMSA's. Unpublished 1970 age detail for “other races” was available, however, to construct a “Negro and other races” age distribution which could then be directly compared with the 1960 race classification.

A more detailed comparison of 1960 and 1970 age-race data can be made for certain of the largest cities. The 1960 age distribution of white, Negro, and other races appears in the 1960 Census volumes for all cities of 100,000 total population or more. For each such city which did not experience boundary changes between 1960 and 1970, a comparison of age detail for the three race groups can be made. A special text table has been prepared to show age distributions of “Negro” population and “Other races” where such information may be of particular interest, as for example in cities which had over 10,000 Negroes in 1960 and in cities which had approximately equal numbers of both race groupings in 1960.

Components of Change.—The components of population change shown in table 3—births, deaths, and net migration—are estimates. As such they are subject to certain limitations unlike the census counts contained in the tables of this report. The estimates are based on reported births and deaths by place of residence, 1960 through 1968, compiled and published by the Division of Vital Statistics, National Center for Health Statistics. Since no vital statistics were readily available for 1969 and the first 3 months of 1970, they were extrapolated using a factor of 1.25 times the average of years 1967-68. Births and deaths were then summed to totals for the decade. Births were corrected by color for underregistration, using factors derived from the

National Center's birth registration test of 1950. As a final step, both births and deaths were adjusted to be consistent with independent State estimates for the decade.

Vital statistics by race were not reported for counties where less than 10 percent of the total population were members of Negro and other races or which had populations of less than 10,000 belonging to these races. These counties are not included in the metropolitan-nonmetropolitan summaries for the State nor for the individual SMSA's when shown by race.

The estimate of net migration was derived as a residual by the following formula: Net Migration = Net Change - Births + Deaths. As a residual value, however, the net migration component reflects the net effect of any errors in the data used, such as differential undercount in the 1960 and 1970 censuses, boundary changes, improper allocation of births and deaths by place of residence, and many others.¹

At the county level very few significant boundary modifications are made. Many cities have annexed territory during the past decade, however, and the shifts resulting from annexation are thrown into the migration component. Special attention is given in the text to the effect of boundary changes on the net migration component for central cities.

Housing

Housing units and group quarters.—All living quarters are classified in the census as either housing units or group quarters. Usually, living quarters are in structures intended for residential use (e.g., a one-family home, apartment house, hotel or motel, boarding house, mobile home or trailer, etc.). Living quarters may also be in structures intended for nonresidential use (e.g., the rooms in a warehouse where a watchman lives), as well as in tents, caves, old railroad cars, etc.

A housing unit is a house, an apartment, a group of rooms, or a single room occupied or intended for occupancy as separate living quarters. Separate living quarters are those in which the occupants do not live and eat with any other persons in the structure and which quarters have either (1) direct access from the outside of the building or through a common hall or (2) complete kitchen facilities for the exclusive use of the occupants. The occupants may be a single family, one person living alone, two or more families living together, or any other group of related or nonrelated persons who share living arrangements (except as described in the next paragraph on group quarters). Both occupied and vacant housing units are included in the housing inven-

tory, except that mobile homes, trailers, tents, etc., are included only if they are occupied.

Group quarters are living arrangements for institutional inmates or for other groups containing five or more persons not related to the person in charge. Group quarters are located most frequently in institutions, boarding houses, military barracks, college dormitories, fraternity and sorority houses, hospitals, monasteries, convents, and ships. A house or apartment is considered group quarters if it is shared by the person in charge and five or more persons unrelated to him, or if there is no person in charge, by six or more unrelated persons. Information on the housing characteristics of group quarters is not collected in the census.

Year-round housing units.—In 1970, data on housing characteristics are limited to year-round housing units—all occupied units plus vacant units which are intended for year-round use—because it is difficult to obtain reliable information for the remaining types of units, i.e., units reported as vacant at the time of the census and intended for seasonal occupancy or held for migratory labor.

In 1960, housing characteristics were provided for all units, including vacant seasonal and vacant migratory units.

Occupied housing units.—A housing unit is classified as occupied if a person or group of persons is living in it at the time of enumeration or if the occupants are only temporarily absent, for example, on vacation. However, if the persons staying in the unit have their usual place of residence elsewhere, the unit is classified as vacant. A household consists of all persons who occupy a housing unit.

Population and persons.—“Population in housing units” is the total population less those persons living in group quarters. “Population per occupied unit” is computed by dividing the population living in housing units by the number of occupied housing units; this is also computed separately for the population in owner and in renter occupied units. The caption “Persons” refers to the number of persons occupying the housing unit; the data show the number of housing units occupied by the specified number of persons.

Race.—The classification by race used in the housing table refers to the race of the head of the household occupying the housing unit. Figures on tenure for 1970 are given separately for all households and for Negro heads of households; for 1960, the tenure figures relate to all households and to household heads of “Negro and other races” (excluding white heads of households). In the 1960 census, the term “nonwhite” was used for Negro and other races. Data on change (1960 to 1970) are shown only when the population data by race indicate that the number of Negro households in 1960

¹For a more detailed discussion of the types of errors which affect estimates of net migration derived in this manner, see *Current Population Reports*, Series P-23 No. 7, pages 13 and 14.

constituted a sufficiently large proportion of household heads of Negro and other races to permit meaningful comparison.

Tenure.—A housing unit is "owner occupied" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owner occupied" only if the owner or co-owner lives in it. All other occupied units are classified as "renter occupied," including units rented for cash rent and those occupied without payment of cash rent.

Vacant housing units.—A housing unit is vacant if no one is living in it at the time of enumeration, unless its occupants are only temporarily absent. In addition, a vacant unit may be one which is entirely occupied by persons who have a usual residence elsewhere. New units not yet occupied are enumerated as vacant housing units if construction has reached a point where all exterior windows and doors are installed and final usable floors are in place. Vacant units are excluded if unfit for human habitation because the roof, walls, windows, or doors no longer protect the interior from the elements, or if there is positive evidence (such as a sign on the house or in the block) that the unit is to be demolished or is condemned.

Vacant housing units are classified in this report as either "seasonal and migratory" (i.e., intended for seasonal occupancy or held for migratory labor) or "year-round." The latter are units which, although vacant at the time of enumeration, are usually occupied or are intended for occupancy at any time of the year. A unit in a resort area which is usually occupied on a year-round basis is considered as a year-round unit. Units used only occasionally throughout the year are also considered year-round units.

Year-round vacant units are subdivided as follows: "For sale only," and "for rent" which also includes vacant units offered either for rent or for sale. All other year-round vacant units are included in the total and may be derived by subtracting the sum of the vacant units "for sale only" and "for rent" from the total. Other year-round vacant units include units sold or rented but not yet occupied by the new owner or renter, units held for the occasional use of the owner, and units held off the market for other reasons.

Homeowner vacancy rate.—The homeowner vacancy rate in 1970 is the number of year-round vacant units for sale as a percent of the total homeowner inventory, i.e., all owner-occupied units and year-round vacant units for sale. In 1960, the homeowner vacancy rate was based on vacant units available for sale, i.e., year-round vacant units for sale in sound or deteriorating condition.

Rental vacancy rate.—The rental vacancy rate in 1970 is the number of year-round vacant units for rent as a

percent of the total rental inventory, i.e., all rented occupied units and all year-round vacant units for rent. In 1960, the rental vacancy rate was based on vacant units available for rent, i.e., year-round vacant units for rent in sound or deteriorating condition.

Rooms.—Rooms to be counted include whole rooms used for living purposes, such as living rooms, dining rooms, kitchens, bedrooms, finished recreation rooms, family rooms, etc. Not counted as rooms are bathrooms, porches, balconies, foyers, halls, halfrooms, kitchenettes, strip or pullman kitchens, utility rooms, unfinished attics, basements, or other space used for storage.

Data on change (1960 to 1970) are not given when the number of vacant seasonal and migratory units that are excluded from the 1970 tabulations is too large to produce meaningful comparisons.

Persons per room.—This is computed by dividing the number of persons in the unit by the number of rooms in the unit. The figures shown refer, therefore, to the number of housing units having the specified ratio of persons per room.

Units in structure.—Statistics on the number of housing units in a structure are presented in terms of one-family houses, number of units in multiunit structures, and mobile homes or trailers.

Data on change (1960 to 1970) are not given when the number of vacant seasonal and migratory units that are excluded from the 1970 tabulations is too large to produce meaningful comparisons.

Plumbing facilities.—The category "with all plumbing facilities" consists of units which have hot and cold piped water, as well as a flush toilet and a bathtub or shower inside the structure for the exclusive use of the occupants of the unit. "Lacking some or all plumbing" means that the unit does not have all three specific plumbing facilities (hot and cold piped water, as well as flush toilet and bathtub or shower inside the structure) or that the toilet or bathing facilities are also for the use of the occupants of other housing units.

For 1960, data on plumbing facilities were derived from information on number of bathrooms. Data for units with all plumbing facilities and with 1.01 or more persons per room are not available from the 1970 reports. Similarly, 1960 data on plumbing facilities are not available by race.

Data on change (1960 to 1970) are not given when the number of vacant seasonal and migratory units that are excluded from the 1970 tabulations is too large to produce meaningful comparisons.

Value.—Value is the respondent's estimate of how much the property (house and lot) would sell for if it were for sale. The term "specified owner occupied" means that in 1970 the value data are limited to owner occupied one-family houses on less than ten acres, without

commercial establishment or medical office on the property. Owner occupied cooperatives, condominiums, mobile homes, and trailers are excluded from the value tabulations.

In 1960 in rural territory, units on farms and all units on places of 10 or more acres (whether farm or nonfarm) were excluded from the value tabulations. In 1970, all units on 10 or more acres are excluded, urban as well as rural; consequently the 1970 value tabulations include farm units of less than 10 acres and exclude units in urban areas on 10 or more acres.

Contract rent—Contract rent is the monthly rent agreed to or contracted for, even if the furnishings, utilities, or services are included. The term "specified renter occupied" means that in 1970 the contract rent data exclude one-family houses on ten acres or more. Renter units occupied without payment of cash rent are shown separately as "no cash rent" in the rent tabulations.

The 1960 rent tabulations excluded farm units and vacant units on 10 or more acres in rural areas. In 1970, all one-family houses on 10 or more acres, whether occupied or vacant and whether urban or rural, are excluded from the rent tabulations.

SOURCES OF DATA

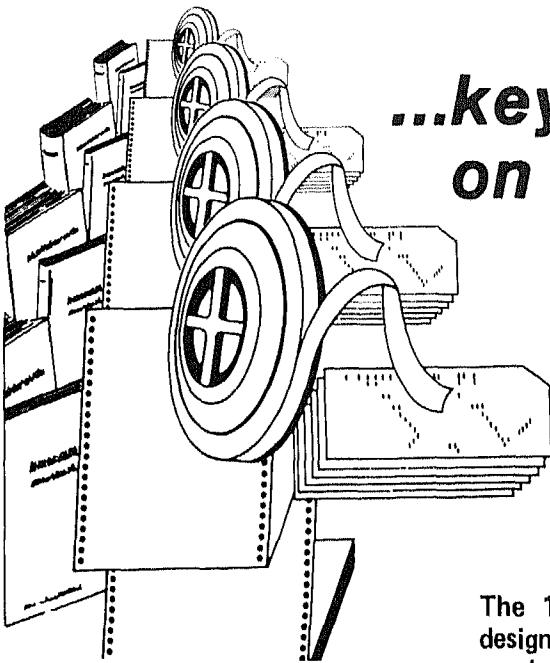

The basic 1970 population and housing data contained in the statistical tables of this series were obtained from

the Advance Reports on Population, PC(V1) and PC(V2), and Housing, HC(V1), issued by the Bureau of the Census for individual States. Certain data on characteristics from those reports are subject to change in the 1970 census PC(1)-B Final Reports on Population and HC(1)-A Final Reports on Housing being issued for States during the spring and summer of 1971.

The PHC(2) Series also contains parallel statistics for 1960, available from published Census sources. 1960 statistics referring to SMSA's have been adjusted to conform to 1970 area definitions. Population and housing characteristics of SMSA's formed during the decade have been reconstructed as of 1960 to complete the comparison with 1970 areas. The source of information regarding criteria for establishment of new SMSA's as well as intercensal adjustments in SMSA boundaries is the Bureau of the Budget publication, *Standard Metropolitan Statistical Areas: 1967*, U.S. Government Printing Office, Washington, D.C. 20402.

Publications of the National Center for Health Statistics were used to develop components of population change. In some cases, supplementary vital statistics were obtained from State health departments.

Some unpublished data from the 1960 Census of Housing were utilized. For those SMSA's which underwent boundary changes from 1960 to 1970, it was necessary to develop a tabulated reprint of 1960 contract rent data on a county basis.

■ Part 1 of the Guide (standard, paper-bound publication) includes the text and three appendixes. The text covers such subjects as the collection and processing of 1970 data, data delivery media (computer tapes, microfilm, and printed materials), maps and information on how to obtain census materials. The appendixes are:

1970 Census Users' Dictionary - defines concepts associated with population and housing tabulations and geographic areas relevant to the collection and publication of data.

Comparison of Printed Reports and Summary Tapes summarizes and compares the contents of the reports and tapes.

Glossary - defines many terms used in connection with collecting, processing, and publishing census data, and lists many abbreviations relevant to the census.

■ Part 2 of the Guide (prepunched for 3-ring binder) contains appendixes specifically related to the use of census summary tapes and the Address Coding Guide.

Technical Conventions and Character Set - present information on the physical characteristics, format, and languages associated with tapes released by the Bureau.

1st-4th Count Technical Documentation - describes the arrangement of geographic codes and census data on the first four series of summary tapes.

Address Coding Guide Technical Documentation - furnishes information on the format and content of ACG's.

Many data users will find both Parts 1 and 2 of great value. Part 1, with its comprehensive coverage of the decennial census program, data products, and related services, is an important instructional and reference tool. Part 2, concerned exclusively with computer tape products, is designed particularly for those who plan to obtain tapes or who want complete information on the data content of the summary tapes.

KENTUCKY

FINAL REPORT

General Demographic Trends for Metropolitan Areas, 1960 to 1970

(This series consists of 52 reports—number 1 for the United States and numbers 2 thru 52 for the States and the District of Columbia in alphabetical order rather than order of publication.)

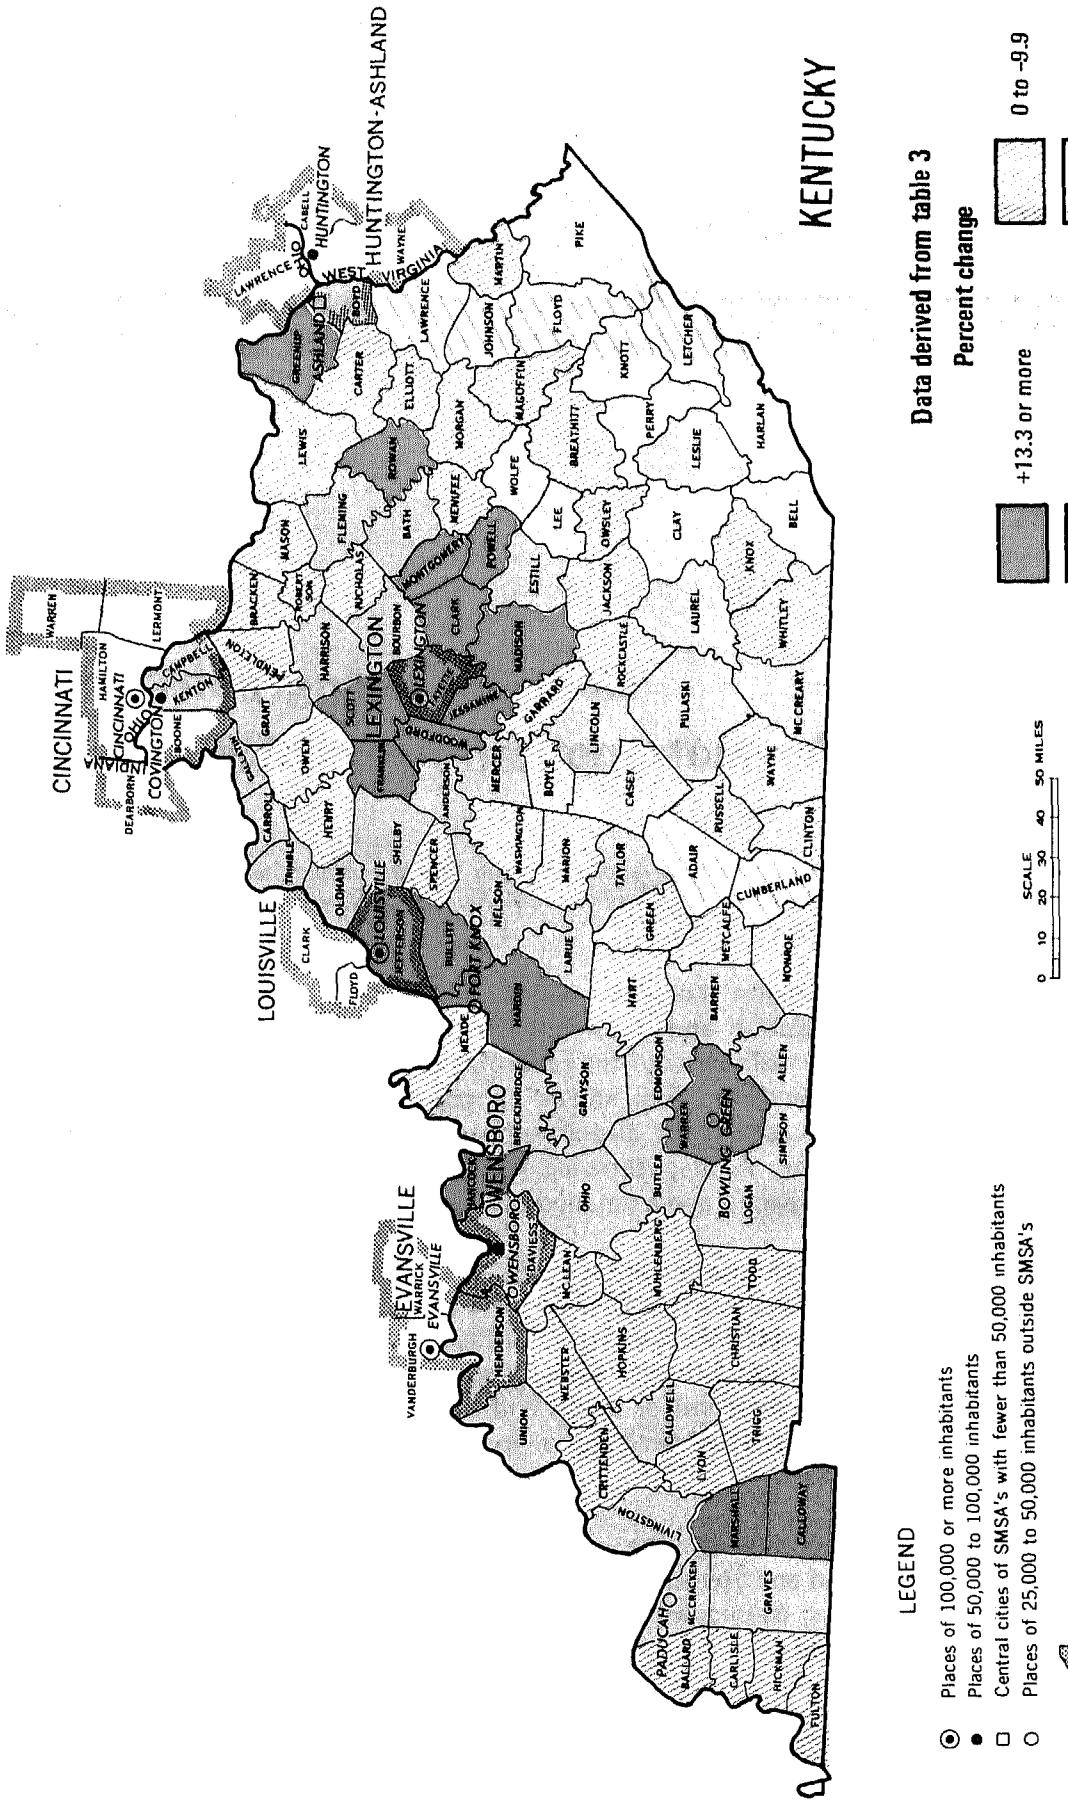

This publication is one of a series of 1970 census reports concerned mainly with population and housing trends in metropolitan areas from 1960 to 1970. The main body of the report consists of an analytical text, a statistical section containing four tables on population characteristics and one on housing characteristics, and an appendix presenting technical definitions and explanations. A map showing 1960-70 population change by county appears on page 2 and a detailed table of contents is on page 3.

The statistics presented here are drawn largely from the 1970 census Advance Reports PC(V2) and HC(V1) for this State. These two reports, which were published several months ago, provide population and housing statistics, respectively, for each standard metropolitan statistical area, place of 10,000 inhabitants or more, and county in the State. Additional data on the subjects covered here appear in the PC(1)-B and HC(1)-A Final Reports for this State.

An outline of the publication program for the 1970 Census of Population and Housing can be obtained free of charge from the Bureau of the Census, Washington, D.C. 20233, or any U.S. Department of Commerce Field Office.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, and U.S. Department of Commerce Field Offices, 25 cents.

POPULATION TRENDS

General

Between 1960 and 1970, the population of Kentucky increased by 181,000 to reach a total of 3,219,000. This was an increase of 6 percent or a little less than half the national rate of 13 percent. Nearly 88 percent of the increase, or about 159,000 persons, were added to the metropolitan population (table A). By far the largest share of the metropolitan increase occurred in the population of suburban areas which grew by 137,000 persons, or 23 percent, while the population of the central cities increased by only 22,000 persons, or 4 percent. Annexation of suburban territory contributed to the modest growth; without it central cities would have lost a total of 48,000 (table B).

The total number of households in Kentucky in 1970 was 983,000, or 131,000 more than in 1960. The population living in households increased less rapidly than the rate at which households increased, with the result that the average household size decreased slightly, from 3.5 to 3.2 persons.

As is typical of States in the South, the majority of Kentucky's population in the past has lived outside metropolitan areas. However, between 1960 and 1970, the metropolitan rate of growth was 14 percent, while the nonmetropolitan areas grew by only 1 percent. As a result, the proportion of the total population living in metropolitan areas rose from 37 percent in 1960 to 40 percent in 1970. This increased metropolitanization has been noted in other States in the South. In the Nation as a whole, about 2 out of 3 persons live in metropolitan areas.

The population of Negro and other races (almost entirely Negro) comprised 8 percent of Kentucky's total population, and 10 percent of the State's metropolitan population. As in the Nation as a whole, most whites in Kentucky's metropolitan areas tend to reside in the suburban ring, while the overwhelming majority of blacks were central city residents. In 1970, 38 percent of the white metropolitan population, but 83 percent of the black metropolitan population were residents of central cities (see table 1).

For the decade, the State experienced a natural increase of 334,000, and an outmigration of 153,000, equivalent to 5 percent of the 1960 population (see table 3). Only in metropolitan areas was there a net immigration. Metropolitan areas gained 21,000 net immigrants and had a natural increase of 138,000; nonmetro-

politan areas experienced a net outmigration of 174,000 and a natural increase of 196,000.

Kentucky's white population had a substantial net outmigration of 158,000 persons. This is a continuation of a long-term outmigration of the white population from the State, but the amount of net outmigration was much reduced from the previous two decades. A reduction in outmigration or reversal from outmigration to immigration in the last decade occurred in many States in the South. The State's population of Negro and other races had a small net immigration of 4,000 persons during this period.

As in other parts of the Nation, Kentucky's age structure changed significantly during the decade. There was a large decrease among the population under 5 years old of age which was due largely to falling birth rates which occurred throughout the United States during the 1960's. The greatest increase occurred in the 15 to 24 age group and was due for the most part to the entry of the large number of persons born during the post-World War II "baby boom." As a result of these changes, the total population under 5 declined from 11 to 8 percent; and the proportion in the 15 to 24 group increased from 15 to 18 percent.

Age changes in the metropolitan and nonmetropolitan areas show some dissimilarities. In the metropolitan population, the age group 5 to 14 grew by 18 percent while the nonmetropolitan population in the same age group declined by 7 percent. The metropolitan population showed substantial gains in the 15 to 24 age group (54 percent) and 65 years old and over (20 percent). This compares with 19 and 13 percent, respectively, for the nonmetropolitan population.

The population of Negro and other races is somewhat younger than the white population. Only 48 percent of the former is over age 25 while 54 percent of the white population is over 25.

Standard Metropolitan Statistical Areas

In 1970 there were six standard metropolitan statistical areas (SMSA's) in Kentucky. Four of these, Cincinnati, Ohio-Ky.-Ind., Evansville, Ind.-Ky., Huntington-Ashland, W. Va.-Ky.-Ohio, and Louisville, Ky.-Ind. are partially located in other States. The discussion of the Cincinnati, Evansville, and Huntington-Ashland SMSA's relate to the portion in Kentucky only. The SMSA's located entirely in Kentucky are Lexington and Owensboro. Each of the SMSA's gained population over the decade.

Table A. Population by Race and Metropolitan and Nonmetropolitan Residence:
1970 and 1960

The State Metropolitan and Non- metropolitan Residence	Population		Change		Percent Distribution	
	1970	1960	Number	Percent	1970	1960

Owensboro.....	50,329	38,172	12,157	42,471	-4,299

Of the 1,288,000 persons living in metropolitan areas in Kentucky, 695,000 (54 percent) lived in the Louisville SMSA. Louisville has long been one of the most important ports, marketing and industrial centers in the South. Between 1960 and 1970, the population of the entire Louisville SMSA increased from 725,000 to 827,000, or by 14 percent. Net immigration contributed only a small proportion of this growth (15,000). The city of Louisville lost population between 1960 and 1970 in spite of annexation of suburban territory. The 1970 population of the area annexed to the city was 13,000. If annexation is excluded, the city would have lost 42,000 persons. The number of whites in the city of Louisville declined by 46,000 over the decade, while the population of Negro and other races increased by 17,000, a trend common to many large cities over the last decade.

The Lexington SMSA, with 174,000 population, had a population increase of 42,000 during the decade. The area is the site of the University of Kentucky, the market center of the Blue Grass region, and a rapidly developing research center. The area's growth was nearly evenly distributed between net immigration and natural increase. Net immigration was equivalent to 17 percent of the 1960 population. The central city of Lexington grew from 63,000 to 108,000, most of which can be attributed to the annexation of suburban territory between 1960 and 1970.

The Owensboro SMSA, which was designated an SMSA in 1970, includes Daviess County. The population grew from 71,000 to 79,000, or by 13 percent. The central city (Owensboro) grew from 42,000 to 50,000, while the balance of the SMSA gained 1,000 persons. The central city's growth is due to the annexation of a suburban population of 12,000. Within the 1960 boundary, the city lost 4,000 population.

In 1970, 251,000 persons, or 18 percent of the population of the Cincinnati SMSA resided in Kentucky. Between 1960 and 1970 the Kentucky portion (Campbell, Kenton, and Boone Counties) grew at the same rate as the SMSA as a whole (9 percent). Population change was made up of a natural increase of 26,000 (52,000 births minus 25,000 deaths) and a net outmigration of 5,000.

Only 15 percent of the entire Evansville SMSA population resided in Kentucky in 1970 (Henderson County). The population of the Kentucky portion of this SMSA grew from 34,000 to 36,000, at a rate of 7.5 percent, almost twice as fast as the entire SMSA.

In 1970 the Kentucky portion of the Huntington-Ashland SMSA contained 21 percent of the total population of the SMSA, or 52,000 persons. This population scarcely changed between 1960 and 1970. Natural increase (10,000 births minus 5,000 deaths) was offset by net outmigration.

Counties

The population of Kentucky's 120 counties ranges from 2,000 for Robertson County to 695,000 for Jefferson County. Of the 120 counties in Kentucky, 59 gained population and 61 lost population between 1960 and 1970. Between 1950 and 1960, 87 counties in Kentucky lost population. In the Nation as a whole, slightly more than half of the counties gained population during the decade.

Nineteen counties had growth rates above the national average of 13 percent, and 11 counties had a population decline exceeding 10 percent. Each of the eight metropolitan counties gained population, and three—Boone, Fayette (Lexington) and Jefferson (Louisville)—counties had rates exceeding the national average. Boone (Cincinnati SMSA), the smallest metropolitan county, was the fastest growing (49 percent), while Bullitt County, contiguous to metropolitan Jefferson County, was the fastest growing nonmetropolitan county (67 percent). During the 1960 to 1970 decade, 25 counties experienced net immigration. Only four counties—Boone, Bullitt, Hancock, and Calloway (Murray State University)—had an immigration rate exceeding 20 percent. Boone County is the only one of the four that is in a metropolitan area. The sudden influx of migrants into Hancock County, which is the smallest of the four, can be attributed to the location of several factories outside Lewisport city in recent years.

Between 1960 and 1970, 49 counties in Kentucky had rates of outmigration equivalent to 10 percent or more of their 1960 population; 45 of these counties had more than half of their populations living in rural areas. The highest rate of net outmigration (43 percent) among Kentucky's counties occurred in predominantly rural Perry County, located in the southeast sector of the State. The Appalachian Counties generally were sources of heavy net outmigration as in the previous two decades. Rural Carlisle County located in the southwestern corner of the State was the only county in Kentucky where deaths exceeded births during the decade.

HOUSING TRENDS

General

Between 1960 and 1970 the total supply of housing units in Kentucky increased more rapidly than population. The population grew by 181,000, or 6 percent, while housing units increased by 137,400, or 15 percent (table C).

The metropolitan areas of the State experienced greater relative growth in housing, as in population, than did the nonmetropolitan part. The number of housing units in metropolitan areas rose from 348,100 to 421,700 over the decade, an increase of 73,600 units, or 21 percent; the increase in nonmetropolitan areas was 63,800 units, or 11 percent. While 40 percent of all housing units were in the metropolitan areas, these areas accounted for 54 percent of the total State increase between 1960 and 1970.

About 80 percent of the housing in Kentucky consisted of one-unit structures in 1970. The number of units in multiunit structures, however, increased at a much faster rate than one-unit structures during the decade, 54 percent and 6 percent, respectively.

The number of units in the State lacking some or all plumbing facilities declined from 367,400 to 219,700, a 40-percent decrease since 1960. In 1970, the proportion of such units was 5 percent in metropolitan areas and 31

percent in nonmetropolitan areas. Approximately 14,400, or 21 percent, of the Negro-occupied units in the State lacked some or all plumbing in 1970. The corresponding proportions for inside and outside the metropolitan areas were 7 percent and 39 percent, respectively.

Households were smaller in 1970 than in 1960. In the metropolitan areas, the average household size declined from 3.4 persons in 1960 to 3.2 in 1970 and, in nonmetropolitan areas, from 3.6 to 3.2 persons. The number of one-person households increased by about 66 percent while two-person households increased by 25 percent. Households with five or more persons increased 8 percent in metropolitan areas and decreased 14 percent in nonmetropolitan areas.

The median number of rooms rose from 4.7 to 4.9 both inside and outside SMSA's. Units with one and two rooms declined in metropolitan and nonmetropolitan areas (21 percent and 30 percent, respectively), while units with seven or more rooms increased 59 percent in metropolitan areas and 10 percent in nonmetropolitan areas.

Number of persons per room is often used as a measure of crowding. In Kentucky, both the number and the proportion of housing units with 1.01 or more persons per room decreased during the decade. In 1960, 15 percent of all occupied housing units in metropolitan areas and 19 percent in nonmetropolitan areas had 1.01 or more persons per room. By 1970, the proportion of

Table C. Housing Units by Metropolitan and Nonmetropolitan Residence: 1970 and 1960

The State Metropolitan and Nonmetropolitan Residence	Housing units				Popula- tion percent change	
	Total		Change			
	1970	1960	Number	Percent		
Total.....	1,062,953	925,572	137,381	14.8	5.9	
Metropolitan residence....	421,686	348,113	73,573	21.1	14.1	
Inside central cities....	196,251	172,589	23,662	13.7	4.2	
Outside central cities....	225,435	175,524	49,911	28.4	22.9	
Nonmetropolitan residence..	641,267	577,457	63,810	11.0	1.1	

such units decreased to 9 percent in metropolitan areas and to 12 percent in nonmetropolitan areas (table D).

The homeownership rate rose slightly in metropolitan areas, from 63 percent in 1960 to 64 percent in 1970. In the nonmetropolitan areas, the owner-occupancy rate rose from 65 to 68 percent. Of the 657,000 owner-occupied units in the State, 257,500 were inside metropolitan areas and 399,500 were outside these areas.

About 45 percent of the Negro households in metropolitan areas and 52 percent in nonmetropolitan areas owned their homes in 1970; both percentages are higher than the corresponding percentages in 1960. About 17,400 Negro-homeowner households lived inside SMSA's and 15,600 lived outside SMSA's.

Property values and rents increased during the last decade. The median value in metropolitan areas increased by 33 percent, from \$11,700 in 1960 to \$15,600 in 1970, while in nonmetropolitan areas the median increased 67 percent, from \$5,700 to \$9,500. In metropolitan areas, median contract rent in 1970 was 45 percent higher than in 1960, rising from \$53 to \$77. In nonmetropolitan areas rent increased by 62 percent, from \$29 to \$47.

Value and rent are expressed in current dollars (the value at the time of the respective censuses). Thus, any comparison must take into account the general rise in the cost of living during the 10-year period, as well as changes in the characteristics of the housing inventory.

Standard Metropolitan Statistical Areas

In the metropolitan areas of the State, the housing supply increased by 73,600 units, or 21 percent. Housing units in the suburbs, which comprised more than half the metropolitan housing in 1970, increased by 49,900 units, or 28 percent; in comparison, housing in the central cities increased by 23,700, or 14 percent. The Kentucky portion of the Louisville, Ky.-Ind. SMSA, which contained 54 percent of the housing units in metropolitan areas, accounted for 52 percent of the increase.

In 1970, about 71 percent of the housing units in the State's metropolitan areas consisted of one-unit structures. The proportion of such units was 62 percent in the central cities and 80 percent in the suburbs.

About 20,200 housing units in metropolitan areas, or 5 percent of all year-round units, lacked some or all plumbing facilities in 1970. The proportion of such units in the central cities was 4 percent and in the suburbs, 6 percent. Approximately 1,600, or 5 percent, of the Negro households in central cities occupied units which lacked some or all plumbing facilities in 1970, compared with 1,200, or 20 percent, of Negro households in suburban areas.

Households were smaller in the central cities than in the suburbs. In the central cities, household size was 2.9 persons compared with 3.4 persons in the suburbs. The proportion of occupied units with one-person house-

holds was 22 percent in the central cities and 12 percent in the suburban areas.

Of all occupied units in metropolitan areas, 37,200, or 9 percent reported more than one person per room in 1970, compared with 15 percent in 1960. In 1970, the proportion of such units was 9 percent in both the central cities and the suburban areas (table D).

Homeownership in 1970 was greater in the suburbs than in the central cities. About 74 percent of occupied units in the suburban areas and 54 percent in the central cities were owner-occupied. The Negro-homeownership rate in the suburbs was 62 percent, compared with 42 percent in the central cities.

Median value of owner-occupied housing was \$13,900 in the central cities compared with \$16,700 in the suburbs. About 22 percent of the owner-occupied housing in the central cities was valued at \$20,000 or

more, compared with 31 percent in the suburbs. Median contract rent in the central cities and the suburbs was \$74 and \$85, respectively. In the central cities 26 percent of renter-occupied units rented for \$100 or more, compared with 37 percent in the suburbs.

The homeowner vacancy rate for metropolitan areas decreased during the decade from 1.6 to 1.1 percent. The rental vacancy rate increased from 6.8 to 8.3.

Annexations

Annexations occurred in the central cities of Louisville, Ashland, Lexington, and Owensboro during the decade (see "Population Trends" and text table B). Such annexations affect changes in the characteristics for these central cities and their suburbs.

DEFINITIONS, EXPLANATIONS, AND SOURCES OF DATA FOLLOW THE TABLES.

CORRECTION NOTE

The corrected 1970 State figure for population is 3,219,311 and for housing is 1,063,115. Detailed distributions shown in this report have not been revised to reflect these corrections, because the errors were discovered after the tabulations were completed. Further information will be provided in the PC(1)-B and HC(1)-A final reports for this State.

For additional information on SMSA's which cross State lines, see PHC(2)-37 for Ohio, PHC(2)-16 for Indiana, and PHC(2)-50 for West Virginia.

Appendix

DEFINITIONS AND EXPLANATIONS

General

PERCENTS, MEDIANs, AND SYMBOLS

Percents which round to less than 0.1 are treated as zero. A dash “-” is the symbol used to signify zero. Three dots “...” indicate that the data are being withheld to avoid disclosure of information, that the base for a median or rate is too small for it to be shown, or that the data were not comparable. A minus sign preceding a figure denotes decrease. The symbol “NA” means not available.

Medians are presented in the housing table of this report for several characteristics. Medians for rooms and persons are rounded to the nearest tenth, for value to the nearest hundred dollars, and for contract rent to the nearest dollar. The median is not shown if there are fewer than five housing units in the distribution. Similarly, population per housing unit is not shown if the base for this rate is less than five units.

USUAL PLACE OF RESIDENCE

In accordance with census practice dating back to 1790, each person enumerated in the 1970 census was counted as an inhabitant of his usual place of residence, which is generally construed to mean the place where he lives and sleeps most of the time. This place is not necessarily the same as his legal residence, voting residence, or domicile. In the vast majority of cases, however, the use of these different bases of classification would produce substantially the same statistics, although there may be appreciable differences for a few areas.

The implementation of this practice has resulted in the establishing of residence rules for certain categories of persons whose usual place of residence is not immediately clear. Furthermore, this practice means that persons were not always counted as residents of the place where they happened to be found by the census enumerators. Persons without a usual place of residence were, however, counted where they were enumerated.

As in every previous census, members of the Armed Forces living on military installations were counted as residents of the area in which the installation was located. Similarly, members of the Armed Forces not living on a military installation were counted as residents of the area in which they were living. Crews of U.S. Navy vessels were counted as residents of the home port to which the particular vessel was assigned; crews of vessels deployed to the overseas fleet were therefore not included in the population of any State or the District of

Columbia. Persons in Armed Forces families were counted where they were living on Census Day (e.g., the military installation, “offbase,” or elsewhere, as the case might be).

Crews of U.S. merchant marine vessels were counted as part of the population of the U.S. port in which their vessel was berthed on Census Day; or if sailing in inland or coastal waters, either the port of departure or destination, depending on which the vessel was nearest on Census Day. Crews of all other U.S. merchant marine vessels are not included in the population of any State or the District of Columbia.

College students, as in 1950 and 1960, were counted as residents of the area in which they were living while attending college. Inmates of institutions, who ordinarily live there for considerable periods of time, were counted as residents of the area where this institution was located; on the other hand, patients in general hospitals, who ordinarily remain for short periods of time, were counted at their homes. On the night of April 6, 1970, a special enumeration was performed in missions, flop-houses, detention centers, etc., and persons enumerated therein were counted as residents of the particular place.

Americans who were overseas for an extended period (in the Armed Forces, working at civilian jobs, studying in foreign universities, etc.) are not included in the population of any of the States or the District of Columbia. On the other hand, persons temporarily abroad on vacations, business trips, and the like, were counted at their usual residence.

Persons in larger hotels, motels, etc., on the night of March 31, 1970, were requested to fill out a census form for allocation back to their homes if they indicated no one was there to report them in the census. A similar approach was used for persons visiting in private residences, as well as for Americans who left the United States during March 1970 via major intercontinental air or ship carriers for temporary travel abroad.

In addition, information on persons away from their usual place of residence was obtained from other members of their families, landladies, etc. If an entire family was expected to be away during the whole period of the enumeration, information on it was obtained from neighbors. A matching process was used to eliminate duplicate reports for a person who reported for himself while away from his usual residence and who was also reported at his usual residence by someone else.

BOUNDARIES

The data shown for 1970 relate to the boundaries of the areas as existed on January 1, 1970. As nearly as

possible, 1960 data for the same areas have been adjusted to conform to the 1970 definitions. However, it was not feasible to compile 1960 information for small pieces of territory transferred from one jurisdiction to another as a result of county and city boundary changes. Where such discrepancies exist note is made in table footnotes. "Extended cities" constitute a special boundary problem discussed below.

COUNTIES

The primary divisions of the States are, in general, termed counties, but in Louisiana these divisions are known as parishes. There are no counties in Alaska. In this State, data are shown for statistical areas which are county equivalents designated as census divisions; they were developed for general statistical purposes through the cooperation of the State and the Census Bureau. In four States (Maryland, Missouri, Nevada, and Virginia), there are one or more cities which are independent of any county organization and thus constitute primary divisions of their States.

STANDARD METROPOLITAN STATISTICAL AREAS

In this report statistics are shown for standard metropolitan statistical areas (SMSA's) except in some tables for New England States where the metropolitan State economic area or nearest equivalent whole county is substituted for the SMSA.

The population living in SMSA's is designated as the metropolitan population. This population is subdivided as "inside central city or cities" and "outside central city or cities." The latter area is frequently referred to in the text of this report as "suburbs" or "suburban ring." The population living outside SMSA's constitutes the non-metropolitan population.

The Bureau of the Census recognizes approximately 250 standard metropolitan statistical areas in the 1970 census. This number includes the 231 SMSA's (including three in Puerto Rico which are not covered in this series) as defined and named in the Bureau of the Budget publication, *Standard Metropolitan Statistical Areas: 1967*, U.S. Government Printing Office, Washington, D.C. 20402. Also included are two SMSA's as defined by the Bureau of the Budget in January 1968: Biloxi-Gulfport, Miss. and Vineland-Millville-Bridgeton, N.J. In addition, a number of SMSA's are being defined on the basis of the results from the 1970 Census.

Except in New England States, a standard metropolitan statistical area is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are socially and economically integrated with the central city. In a few cities where portions of

counties outside the SMSA as defined in 1967 were annexed to the central city, the population living in those counties is not considered part of the central city. In the New England States, SMSA's consist of towns and cities instead of counties. Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. For the complete description of the criteria used in defining SMSA's, see the Bureau of the Budget publication cited above.

STATE ECONOMIC AREAS

For the New England metropolitan areas represented in some of the tables of these reports, the SMSA has been replaced by the metropolitan State economic area (SEA) (see U.S. Census of Population, 1960, *State Economic Areas*, PC(3)1A.) Where a metropolitan SEA has not been defined, the nearest equivalent county has been used. State summaries by metropolitan and nonmetropolitan residence will, therefore, be found to vary according to whether the information contained in the tables was available for SMSA's directly or for counties only. Population tables 2,3, and 4 contain metropolitan SEA totals, while Housing table 5 shows SMSA totals. Under both systems, figures for central cities are the same.

ANNEXATIONS

A problem of definition exists with respect to some of the central cities shown in these reports. This problem arises as a consequence of annexations of territory made by cities during the 1960-70 decade. Most often, detailed population and housing characteristics from the 1960 census could not be reproduced for the annexed areas. 1960 data shown for central cities in the tables of this report thus relate to those cities as defined at the time of that census, and 1970 data refer to cities as they were defined for the 1970 census.

To clarify the impact of annexation on population change for central cities, a text table has been prepared. It shows 1970 population in current boundaries and within 1960 boundaries for central cities which annexed population. Population change within a consistently defined area, that is, excluding the effect of annexation, can then be obtained.

Since 1960, two cities have annexed the entire county in which they were located: Jacksonville, Fla. (whose boundaries in 1970 are coterminous with Duval County) and Nashville, Tenn. (whose boundaries are now coterminous with Davidson County). Indianapolis, Ind. annexed all parts of Marion County except for Beech Grove, Lawrence, Speedway, and Southport, whose combined 1960 population amounted to 31,600 out of a county total of 698,000. For these three cities (Jacksonville, Nashville, and Indianapolis), 1960 data are presented in terms of their 1970 bound-

aries. Data from the 1960 census for Duval and Davidson Counties were substituted for Jacksonville and Nashville cities as they were defined at the time of the 1960 census. Indianapolis was also considered to be coterminous with Marion County as the effect of including the four places listed above was not great enough to require a special adjustment.

EXTENDED CITIES

A number of cities contain territory essentially rural in character. The classification of all the inhabitants and housing of such cities as urban would include in the urban category persons and housing units in areas primarily rural in character. The Census Bureau therefore established certain rules to identify such cities—which are designated as "extended cities"—and to separate each into its urban and rural portions. As a concomitant of this approach, when an extended city is the central city of an SMSA, most of the 1970 census reports show only the urban portion as the central city. In the present report, however, the entire (or "legal") city is shown as the central city because the focus here is on comparisons with 1960, and this type of delineation was not made in 1960. The effect of annexation of these extended cities, which can be especially great, is shown in a text table, where appropriate.

STANDARD CONSOLIDATED AREAS

In view of the special importance of the metropolitan complexes around New York and Chicago, the Nation's two largest cities, several contiguous SMSA's and additional counties that do not appear to meet the formal integration criteria but do have strong interrelationships of other kinds have been combined into the New York-Northeastern New Jersey and the Chicago-Northwestern Indiana Standard Consolidated Areas, respectively. The former consists of Middlesex and Somerset Counties in New Jersey and the following SMSA's: New York, Newark, Jersey City, and Paterson-Clifton-Passaic. The latter consists of the following SMSA's: Chicago and Gary-Hammond-East Chicago.

Population

Age.—The age classification is based on the age of the person in completed years as of April 1 of the census years 1960 and 1970.

Race.—The concept of race as used by the Census Bureau does not denote clear-cut scientific definitions of biological stock. Rather it reflects self-identification by respondents. Since the 1960 and 1970 censuses obtained information on race principally through self-enumeration, the data represent essentially self-classification by people according to the race with which they identify themselves. For persons of mixed parentage who are in doubt as to their classification, the race of the person's father is used. Persons of Mexican or Puerto Rican birth

or ancestry who do not identify themselves as of a race other than white (e.g., American Indian, Negro, etc.) are classified as white. In the three-category grouping shown in this report, the "other" category consists of all races except white or Negro, i.e., American Indian, Japanese, Chinese, Filipino, Korean, Eskimo, etc.

1970 age-race data taken from the published PC(V2) Series of Advance Population Reports were available for two major population groups: "Total" and "Negro". In presenting comparable age-race statistics for SMSA's and their component parts in the present series of reports, however, race is classified as "white" and "Negro and other races." This is the classification employed in the 1960 census, except that "nonwhite" was the term used for "Negro and other races." It has been kept in two tables of this series (tables 3 and 4) either because of the difficulty or inadvisability of substituting "Negro" only for the broader "nonwhite" classification. As an example of one of the difficulties encountered in making this substitution, it was found that 1960 age detail by race could not be reproduced for the Negro population of counties or county substitutes, which are the building blocks of SMSA's. Unpublished 1970 age detail for "other races" was available, however, to construct a "Negro and other races" age distribution which could then be directly compared with the 1960 race classification.

A more detailed comparison of 1960 and 1970 age-race data can be made for certain of the largest cities. The 1960 age distribution of white, Negro, and other races appears in the 1960 Census volumes for all cities of 100,000 total population or more. For each such city which did not experience boundary changes between 1960 and 1970, a comparison of age detail for the three race groups can be made. A special text table has been prepared to show age distributions of "Negro" population and "Other races" where such information may be of particular interest, as for example in cities which had over 10,000 Negroes in 1960 and in cities which had approximately equal numbers of both race groupings in 1960.

Components of Change.—The components of population change shown in table 3—births, deaths, and net migration—are estimates. As such they are subject to certain limitations unlike the census counts contained in the tables of this report. The estimates are based on reported births and deaths by place of residence, 1960 through 1968, compiled and published by the Division of Vital Statistics, National Center for Health Statistics. Since no vital statistics were readily available for 1969 and the first 3 months of 1970, they were extrapolated using a factor of 1.25 times the average of years 1967-68. Births and deaths were then summed to totals for the decade. Births were corrected by color for underregistration, using factors derived from the

National Center's birth registration test of 1950. As a final step, both births and deaths were adjusted to be consistent with independent State estimates for the decade.

Vital statistics by race were not reported for counties where less than 10 percent of the total population were members of Negro and other races or which had populations of less than 10,000 belonging to these races. These counties are not included in the metropolitan-nonmetropolitan summaries for the State nor for the individual SMSA's when shown by race.

The estimate of net migration was derived as a residual by the following formula: Net Migration = Net Change - Births + Deaths. As a residual value, however, the net migration component reflects the net effect of any errors in the data used, such as differential undercount in the 1960 and 1970 censuses, boundary changes, improper allocation of births and deaths by place of residence, and many others.¹

At the county level very few significant boundary modifications are made. Many cities have annexed territory during the past decade, however, and the shifts resulting from annexation are thrown into the migration component. Special attention is given in the text to the effect of boundary changes on the net migration component for central cities.

Housing

Housing units and group quarters.—All living quarters are classified in the census as either housing units or group quarters. Usually, living quarters are in structures intended for residential use (e.g., a one-family home, apartment house, hotel or motel, boarding house, mobile home or trailer, etc.). Living quarters may also be in structures intended for nonresidential use (e.g., the rooms in a warehouse where a watchman lives), as well as in tents, caves, old railroad cars, etc.

A housing unit is a house, an apartment, a group of rooms, or a single room occupied or intended for occupancy as separate living quarters. Separate living quarters are those in which the occupants do not live and eat with any other persons in the structure and which quarters have either (1) direct access from the outside of the building or through a common hall or (2) complete kitchen facilities for the exclusive use of the occupants. The occupants may be a single family, one person living alone, two or more families living together, or any other group of related or nonrelated persons who share living arrangements (except as described in the next paragraph on group quarters). Both occupied and vacant housing units are included in the housing inventory, except that mobile homes, trailers, tents, etc., are included only if they are occupied.

Group quarters are living arrangements for institutional inmates or for other groups containing five or more persons not related to the person in charge. Group quarters are located most frequently in institutions, boarding houses, military barracks, college dormitories, fraternity and sorority houses, hospitals, monasteries, convents, and ships. A house or apartment is considered group quarters if it is shared by the person in charge and five or more persons unrelated to him, or if there is no person in charge, by six or more unrelated persons. Information on the housing characteristics of group quarters is not collected in the census.

Year-round housing units.—In 1970, data on housing characteristics are limited to year-round housing units—all occupied units plus vacant units which are intended for year-round use—because it is difficult to obtain reliable information for the remaining types of units, i.e., units reported as vacant at the time of the census and intended for seasonal occupancy or held for migratory labor.

In 1960, housing characteristics were provided for all units, including vacant seasonal and vacant migratory units.

Occupied housing units.—A housing unit is classified as occupied if a person or group of persons is living in it at the time of enumeration or if the occupants are only temporarily absent, for example, on vacation. However, if the persons staying in the unit have their usual place of residence elsewhere, the unit is classified as vacant. A household consists of all persons who occupy a housing unit.

Population and persons.—“Population in housing units” is the total population less those persons living in group quarters. “Population per occupied unit” is computed by dividing the population living in housing units by the number of occupied housing units; this is also computed separately for the population in owner and in renter occupied units. The caption “Persons” refers to the number of persons occupying the housing unit; the data show the number of housing units occupied by the specified number of persons.

Race.—The classification by race used in the housing table refers to the race of the head of the household occupying the housing unit. Figures on tenure for 1970 are given separately for all households and for Negro heads of households; for 1960, the tenure figures relate to all households and to household heads of “Negro and other races” (excluding white heads of households). In the 1960 census, the term “nonwhite” was used for Negro and other races. Data on change (1960 to 1970) are shown only when the population data by race indicate that the number of Negro households in 1960

¹ For a more detailed discussion of the types of errors which affect estimates of net migration derived in this manner, see *Current Population Reports*, Series P-23 No. 7, pages 13 and 14.

constituted a sufficiently large proportion of household heads of Negro and other races to permit meaningful comparison.

Tenure.—A housing unit is "owner occupied" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owner occupied" only if the owner or co-owner lives in it. All other occupied units are classified as "renter occupied," including units rented for cash rent and those occupied without payment of cash rent.

Vacant housing units.—A housing unit is vacant if no one is living in it at the time of enumeration, unless its occupants are only temporarily absent. In addition, a vacant unit may be one which is entirely occupied by persons who have a usual residence elsewhere. New units not yet occupied are enumerated as vacant housing units if construction has reached a point where all exterior windows and doors are installed and final usable floors are in place. Vacant units are excluded if unfit for human habitation because the roof, walls, windows, or doors no longer protect the interior from the elements, or if there is positive evidence (such as a sign on the house or in the block) that the unit is to be demolished or is condemned.

Vacant housing units are classified in this report as either "seasonal and migratory" (i.e., intended for seasonal occupancy or held for migratory labor) or "year-round." The latter are units which, although vacant at the time of enumeration, are usually occupied or are intended for occupancy at any time of the year. A unit in a resort area which is usually occupied on a year-round basis is considered as a year-round unit. Units used only occasionally throughout the year are also considered year-round units.

Year-round vacant units are subdivided as follows: "For sale only," and "for rent" which also includes vacant units offered either for rent or for sale. All other year-round vacant units are included in the total and may be derived by subtracting the sum of the vacant units "for sale only" and "for rent" from the total. Other year-round vacant units include units sold or rented but not yet occupied by the new owner or renter, units held for the occasional use of the owner, and units held off the market for other reasons.

Homeowner vacancy rate.—The homeowner vacancy rate in 1970 is the number of year-round vacant units for sale as a percent of the total homeowner inventory, i.e., all owner-occupied units and year-round vacant units for sale. In 1960, the homeowner vacancy rate was based on vacant units available for sale, i.e., year-round vacant units for sale in sound or deteriorating condition.

Rental vacancy rate.—The rental vacancy rate in 1970 is the number of year-round vacant units for rent as a

percent of the total rental inventory, i.e., all renter-occupied units and all year-round vacant units for rent. In 1960, the rental vacancy rate was based on vacant units available for rent, i.e., year-round vacant units for rent in sound or deteriorating condition.

Rooms.—Rooms to be counted include whole rooms used for living purposes, such as living rooms, dining rooms, kitchens, bedrooms, finished recreation rooms, family rooms, etc. Not counted as rooms are bathrooms, porches, balconies, foyers, halls, halfrooms, kitchenettes, strip or pullman kitchens, utility rooms, unfinished attics, basements, or other space used for storage.

Data on change (1960 to 1970) are not given when the number of vacant seasonal and migratory units that are excluded from the 1970 tabulations is too large to produce meaningful comparisons.

Persons per room.—This is computed by dividing the number of persons in the unit by the number of rooms in the unit. The figures shown refer, therefore, to the number of housing units having the specified ratio of persons per room.

Units in structure.—Statistics on the number of housing units in a structure are presented in terms of one-family houses, number of units in multiunit structures, and mobile homes or trailers.

Data on change (1960 to 1970) are not given when the number of vacant seasonal and migratory units that are excluded from the 1970 tabulations is too large to produce meaningful comparisons.

Plumbing facilities.—The category "with all plumbing facilities" consists of units which have hot and cold piped water, as well as a flush toilet and a bathtub or shower inside the structure for the exclusive use of the occupants of the unit. "Lacking some or all plumbing" means that the unit does not have all three specified plumbing facilities (hot and cold piped water, as well as flush toilet and bathtub or shower inside the structure), or that the toilet or bathing facilities are also for the use of the occupants of other housing units.

For 1960, data on plumbing facilities were derived from information on number of bathrooms. Data for units with all plumbing facilities and with 1.01 or more persons per room are not available from the 1960 reports. Similarly, 1960 data on plumbing facilities are not available by race.

Data on change (1960 to 1970) are not given when the number of vacant seasonal and migratory units that are excluded from the 1970 tabulations is too large to produce meaningful comparisons.

Value.—Value is the respondent's estimate of how much the property (house and lot) would sell for if it were for sale. The term "specified owner occupied" means that in 1970 the value data are limited to owner occupied, one-family houses on less than ten acres, without a

commercial establishment or medical office on the property. Owner occupied cooperatives, condominiums, mobile homes, and trailers are excluded from the value tabulations.

In 1960 in rural territory, units on farms and all units on places of 10 or more acres (whether farm or nonfarm) were excluded from the value tabulations. In 1970, all units on 10 or more acres are excluded, urban as well as rural; consequently the 1970 value tabulations include farm units of less than 10 acres and exclude units in urban areas on 10 or more acres.

Contract rent—Contract rent is the monthly rent agreed to or contracted for, even if the furnishings, utilities, or services are included. The term "specified renter occupied" means that in 1970 the contract rent data exclude one-family houses on ten acres or more. Renter units occupied without payment of cash rent are shown separately as "no cash rent" in the rent tabulations.

The 1960 rent tabulations excluded farm units and vacant units on 10 or more acres in rural areas. In 1970, all one-family houses on 10 or more acres, whether occupied or vacant and whether urban or rural, are excluded from the rent tabulations.

SOURCES OF DATA

The basic 1970 population and housing data contained in the statistical tables of this series were obtained from

the Advance Reports on Population, PC(V1) and PC(V2), and Housing, HC(V1), issued by the Bureau of the Census for individual States. Certain data on characteristics from those reports are subject to change in the 1970 census PC(1)-B Final Reports on Population and HC(1)-A Final Reports on Housing being issued for States during the spring and summer of 1971.

The PHC(2) Series also contains parallel statistics for 1960, available from published Census sources. 1960 statistics referring to SMSA's have been adjusted to conform to 1970 area definitions. Population and housing characteristics of SMSA's formed during the decade have been reconstructed as of 1960 to complete the comparison with 1970 areas. The source of information regarding criteria for establishment of new SMSA's as well as intercensal adjustments in SMSA boundaries is the Bureau of the Budget publication, *Standard Metropolitan Statistical Areas: 1967*, U.S. Government Printing Office, Washington, D.C. 20402.

Publications of the National Center for Health Statistics were used to develop components of population change. In some cases, supplementary vital statistics were obtained from State health departments.

Some unpublished data from the 1960 Census of Housing were utilized. For those SMSA's which underwent boundary changes from 1960 to 1970, it was necessary to develop a tabulated reprint of 1960 contract rent data on a county basis.

PC(2)-20

General Demographic Trends for Metropolitan Areas, 1960 to 1970

(This series consists of 52 reports—number 1 for the United States and numbers 2 thru 52 for the States and the District of Columbia in alphabetical order rather than order of publication.)

This publication is one of a series of 1970 census reports concerned mainly with population and housing trends in metropolitan areas from 1960 to 1970. The main body of the report consists of an analytical text, a statistical section containing four tables on population characteristics and one on housing characteristics, and an appendix presenting technical definitions and explanations. A map showing 1960-70 population change by parish appears on page 2 and a detailed table of contents is on page 3.

The statistics presented here are drawn largely from the 1970 census Advance Reports PC(V2) and HC(V1) for this State. These two reports, which were published several months ago, provide population and housing statistics, respectively, for each standard metropolitan statistical area, place of 10,000 inhabitants or more, and parish in the State. Additional data on the subjects covered here appear in the PC(1)-B and HC(1)-A Final Reports for this State.

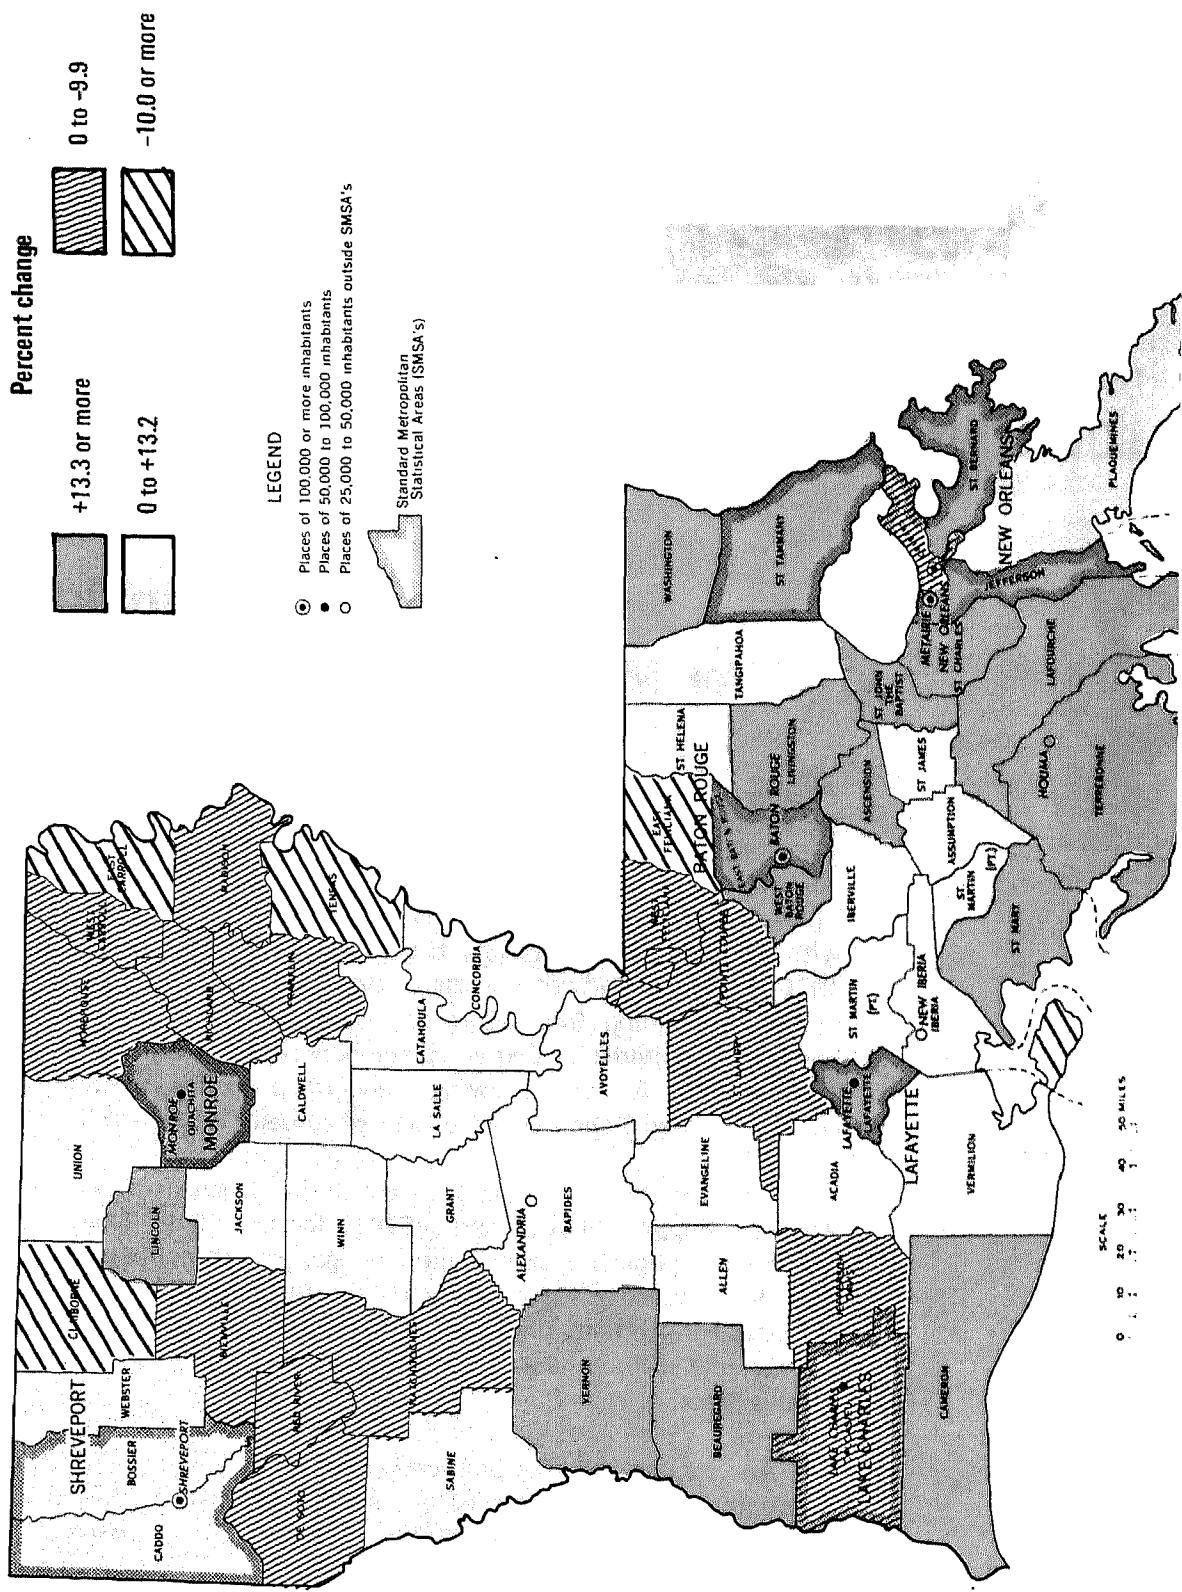

An outline of the publication program for the 1970 Census of Population and Housing can be obtained free of charge from the Bureau of the Census, Washington, D.C. 20233, or any U.S. Department of Commerce Field Office.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, and U.S. Department of Commerce Field Offices, 25 cents.

POPULATION TRENDS

General

Between 1960 and 1970 the total population of Louisiana grew by nearly 385,000, from 3,257,000 to 3,641,000, an increase of 11.8 percent over the population living in the State in 1960 (table A). This moderate increase is the average of metropolitan and nonmetropolitan rates of increase which vary considerably; while nonmetropolitan areas grew by 9 percent, central cities grew by only 4 percent and areas outside central cities by 31 percent.

The total number of households in the State in 1970 was 1,052,000, or 160,000 more than in 1960. The population living in households increased less rapidly than the rate at which new households were formed with the result that average household size decreased slightly, from 3.6 to 3.4 persons per unit.

The effect of these changes on population distribution by metropolitan-nonmetropolitan residence was very small. The proportion of the total population living in metropolitan areas increased by only 1 percent during the decade. About one out of every two persons in Louisiana now lives in metropolitan areas, compared with the national average of two out of three.

The proportion of whites in the nonmetropolitan areas increased from 66 to 69 percent between 1960 and 1970, but in metropolitan areas the white proportion was constant (70 percent). However, within metropolitan areas, there was a significant shift. In areas outside central cities, the proportion of whites rose from 77 to 82 percent between 1960 and 1970; collaterally, their proportion inside central cities declined from 65 to 61 percent.

The excess of births over deaths between 1960 and 1970 assured the State of population growth despite a net outmigration of 132,000. Diverse trends underlie

¹See correction note on page 8.

this net outmigration. Over the decade, there was a net immigration of whites amounting to 26,000 and a net outmigration of Negroes of 158,000. Net losses of population were registered outside metropolitan areas and inside the central cities of metropolitan areas, but net gains were registered in metropolitan areas outside central cities (see table 3).

Throughout the State both whites and Negroes experienced significant changes in age composition over the 1960-70 decade. The age group 15-24 registered the largest numerical gains (see table 4). On the other hand, declines or only small gains were registered by the under 5 and the 25 to 44 groups. Similar changes are found in other sections of the country and are due in part to changing birth rates and in part to migration, which is highly selective by age. Low birth rates during the depression years and in the 1960's contribute to the diminution of age groups 25 to 44, and under 5, whereas the post-World War II "baby boom" is currently reflected in the large size of the population 15-24 years old.

Standard Metropolitan Statistical Areas

The Standard Metropolitan Statistical Areas (SMSA's) in Louisiana while different in size and certain other characteristics, are closely alike in the proportion of the population that is Negro. New Orleans is the largest SMSA with a population of more than one million. It is a port and has substantial trade and financial functions. Shreveport is next in size with a population of 295,000; it is an oil and gas extraction area and contains a significant military establishment. Baton Rouge, which is third in size (285,000 population) is characterized by the functions of a State capital; it is also the site of a chemical manufacturing industry, and growing university

(Louisiana State University). The three smaller areas, Lafayette, Monroe and Lake Charles, range in population from 109,000 to 145,000. They carry out trade and financial functions in their areas.

Annexation of territory during the decade was responsible for additions to the population of central cities in five of Louisiana's metropolitan areas (table B). These annexations enabled the central cities to show an increase over the 1960-70 period. Without them, only Lafayette would have shown an increase in its central city population. Baton Rouge, Monroe and New Orleans all showed significant gains in their suburbs over the 1960-70 period. On the other hand, Lafayette, Lake Charles and Shreveport registered declines in their suburbs due to de-annexation.

Changes in the population by age for each of the six SMSA's in Louisiana show the same tendencies noted for the State as a whole: losses or small increases for age groups under 5 and 25 to 44 years, accompanied by large gains in age groups 15 to 24 and 45 to 64 years (see table 4).

Parishes

Between 1960 and 1970, 44 of the 64 parishes in Louisiana increased in population. Nineteen of these grew at rates which exceeded the 13.3 percent rate of population increase for the nation as a whole. This latter group for the most part consists either of metropolitan parishes or of parishes neighboring metropolitan areas. They are concentrated in the southeastern part of the State. Two parishes with populations over 200,000, East Baton Rouge and Jefferson, had increases of 24 percent and 62 percent, respectively. The parish showing the largest gain, Vernon, is on the central west border of the State. It grew at the rate of 194 percent. This large gain reflected the reactivation of Fort Polk in the parish.

Table B. Change in Population of Central Cities Through Annexation: 1960 to 1970

			-6,977
			3,479
			-3,073
			-1,291
			-7,834

Of the 20 parishes that showed losses in population between 1960 and 1970, only four showed losses of 10 percent or more. Most of the parishes showing losses are located in the northern section of the State. The two parishes showing losses and having large populations are Orleans (-5.4%) with a population of 593,000 and St. Landry (-1.4%) with a population of 80,000.

Every parish had more births than deaths during the decade (see table 3). In 20 parishes, however, net outmigration was more than sufficient to wipe out the gains contributed by natural increase of the total population. Large parishes with substantial outmigration were Orleans and St. Landry. All parishes, except two, contained a large enough population of races other than white to have this population group shown separately in table 3. Thirty-three of these 62 parishes had sufficient net outmigration to more than wipe out the gains from the excess of births over deaths.

Only seven parishes had substantial net immigration which amounted to more than 10 percent of their 1960 population. They were the fastest growing parishes over the 1960-70 decade. Chief among these are Vernon Parish, mentioned above, with an overall growth rate of 194 percent and a net immigration rate of 180 percent; and the suburban New Orleans parishes of Jefferson, with a growth rate of 62 percent and a net immigration rate of 38 percent, of St. Tammany with a growth rate of 65 percent and a net immigration rate of 46 percent, and of St. Bernard with a growth rate of 59 percent and a net immigration rate of 38 percent.

HOUSING TRENDS

General

During the decade, the total supply of housing units in Louisiana increased more rapidly than population. While the population grew by 384,000, or 12 percent, the number of housing units increased by 170,600, or 17 percent (table C).

The metropolitan areas of the State experienced greater relative growth in housing, as in population, than did the nonmetropolitan part. The number of housing units in metropolitan areas rose from 539,100 to 647,300 over the decade, an increase of 108,200 units, or 20 percent; this compares with an increase of 62,300 units, or 14 percent, in nonmetropolitan areas. While 56 percent of all housing units were in metropolitan areas, these areas accounted for 63 percent of the total State increase between 1960 and 1970.

About 78 percent of the housing in Louisiana consisted of one-unit structures in 1970. The number of units in multiunit structures, however, increased at a faster rate than one-unit structures during the decade, 36 percent and 10 percent, respectively.

The size of housing units increased between 1960 and 1970. Median number of rooms rose from 4.5 to 4.8 in both metropolitan and nonmetropolitan areas. Units with one to three rooms declined, whereas those with five rooms or more had large percentage increases over the decade.

Table C. Housing Units by Metropolitan and Nonmetropolitan Residence: 1970 and 1960

The State
Metropolitan and
Nonmetropolitan Residence

Total.....	1,149,033	978,452	170,581	17.4	11.8

	Housing units				Popula- tion percent change	
	Total		Change			
	1970	1960	Number	Percent		
Total.....	1,149,033	978,452	170,581	17.4	11.8	
Metropolitan residence.....	647,334	539,090	108,244	20.1	14.0	
Inside central cities....	391,624	350,586	41,038	11.7	4.0	
Outside central cities...	255,710	188,504	67,206	35.7	31.0	
Nonmetropolitan residence..	501,699	439,362	62,337	14.2	9.2	

Households were smaller in 1970 than in 1960. In metropolitan areas, population per housing unit occupied declined from 3.5 in 1960 to 3.3 in 1970, and in nonmetropolitan areas, from 3.8 in 1960 to 3.5 in 1970. There were large percentage increases in one-person households, 55 percent in metropolitan areas and 52 percent in nonmetropolitan areas. Households with five or more persons showed relatively small gains in metropolitan areas and losses in nonmetropolitan areas.

The proportion of housing units lacking some or all plumbing facilities decreased from 30 to 12 percent during the decade in Louisiana. For metropolitan areas the proportion of units without complete plumbing facilities in 1970 was 5 percent as compared with 20 percent for nonmetropolitan areas.

Number of persons per room is often used as a measure of crowding. For the State, units with 1.01 or more persons per room comprised 15 percent of all occupied units in 1970, compared with 21 percent in 1960 (table D). The number of all such units in 1970 was 152,800, a decrease of about 35,300, or 19 percent, between 1960 and 1970. The decline occurred in metropolitan and nonmetropolitan areas alike, but in nonmetropolitan areas the improvement was somewhat greater.

Homeownership in the State increased from 59 percent in 1960 to 63 percent in 1970. In metropolitan areas there was an increase from 55 to 59 percent, while

in nonmetropolitan areas the proportion increased from 64 to 69 percent.

Property values and rents increased during the last decade. The median value of owner-occupied housing in metropolitan areas increased by 33 percent (\$13,200 in 1960 to \$17,500 in 1970), while in nonmetropolitan areas value increased by 44 percent (\$7,200 in 1960 to \$10,400 in 1970). In metropolitan areas, median contract rent in 1970 was 38 percent higher than in 1960, rising from \$50 to \$69. In nonmetropolitan areas rent increased during the 10-year period from \$26 to \$43, or 65 percent.

Value and rent are expressed in current dollars (the value at the time of the respective censuses). Thus, any comparison must take into account the general rise in the cost of living during the 10-year period as well as changes in the characteristics of the housing inventory.

Standard Metropolitan Statistical Areas

Average household size for the metropolitan area total of the State decreased during the decade. Population per occupied unit in the central cities was 3.1 in 1970, compared with 3.6 in the suburbs.

The rate of homeownership was greater in the suburban areas than in the central cities. About 72 percent of occupied units in the suburbs were owner-occupied, compared with 49 percent in the central cities.

Table D. Plumbing Facilities and Persons Per Room by Metropolitan and Nonmetropolitan Residence: 1970 and 1960

The State
Metropolitan and
Nonmetropolitan Residence

	Percent of housing units			
	Lacking some or all plumbing facilities		With 1.01 or more persons per room ¹

	19.6	(NA)	16.8	24.2

NA Not available.

¹Percent of all occupied units.

²Percent of all year-round housing units.

³Percent of all housing units.

In 1970, 4 percent of all year-round housing units lacked some or all plumbing facilities in the central cities, compared with 7 percent in the suburbs. Of all occupied units in metropolitan areas, 76,200 units, or 13 percent, reported more than one person per room in 1970, compared with 19 percent in 1960. In 1970, the proportion of such units was approximately the same in both the central cities and the suburbs.

The homeowner vacancy rate for metropolitan areas declined during the decade, from 2.4 percent in 1960 to

1.7 percent in 1970. The rental vacancy rate increased, however, from 7.3 to 9.8 percent.

Annexations

Annexations occurred in each of the central cities during the decade (see "Population Trends" and text table B). Such annexations affect changes in the characteristics for these central cities and their suburbs.

DEFINITIONS, EXPLANATIONS, AND SOURCES OF DATA FOLLOW THE TABLES.

CORRECTION NOTE

The corrected 1970 State figure for population is 3,643,180 and for housing is 1,149,467. Detailed distributions shown in this report have not been revised to reflect these corrections, because the errors were discovered after the tabulations were completed. Further information will be provided in the PC(1)-B and HC(1)-A final reports for this State.

Appendix

DEFINITIONS AND EXPLANATIONS

General

PERCENTS, MEDIANs, AND SYMBOLS

Percents which round to less than 0.1 are treated as zero. A dash “-” is the symbol used to signify zero. Three dots “...” indicate that the data are being withheld to avoid disclosure of information, that the base for a median or rate is too small for it to be shown, or that the data were not comparable. A minus sign preceding a figure denotes decrease. The symbol “NA” means not available.

Medians are presented in the housing table of this report for several characteristics. Medians for rooms and persons are rounded to the nearest tenth, for value to the nearest hundred dollars, and for contract rent to the nearest dollar. The median is not shown if there are fewer than five housing units in the distribution. Similarly, population per housing unit is not shown if the base for this rate is less than five units.

USUAL PLACE OF RESIDENCE

In accordance with census practice dating back to 1790, each person enumerated in the 1970 census was counted as an inhabitant of his usual place of residence, which is generally construed to mean the place where he lives and sleeps most of the time. This place is not necessarily the same as his legal residence, voting residence, or domicile. In the vast majority of cases, however, the use of these different bases of classification would produce substantially the same statistics, although there may be appreciable differences for a few areas.

The implementation of this practice has resulted in the establishing of residence rules for certain categories of persons whose usual place of residence is not immediately clear. Furthermore, this practice means that persons were not always counted as residents of the place where they happened to be found by the census enumerators. Persons without a usual place of residence were, however, counted where they were enumerated.

As in every previous census, members of the Armed Forces living on military installations were counted as residents of the area in which the installation was located. Similarly, members of the Armed Forces not living on a military installation were counted as residents of the area in which they were living. Crews of U.S. Navy vessels were counted as residents of the home port to which the particular vessel was assigned; crews of vessels deployed to the overseas fleet were therefore not included in the population of any State or the District of

Columbia. Persons in Armed Forces families were counted where they were living on Census Day (e.g., the military installation, “offbase,” or elsewhere, as the case might be).

Crews of U.S. merchant marine vessels were counted as part of the population of the U.S. port in which their vessel was berthed on Census Day; or if sailing in inland or coastal waters, either the port of departure or destination, depending on which the vessel was nearest on Census Day. Crews of all other U.S. merchant marine vessels are not included in the population of any State or the District of Columbia.

College students, as in 1950 and 1960, were counted as residents of the area in which they were living while attending college. Inmates of institutions, who ordinarily live there for considerable periods of time, were counted as residents of the area where this institution was located; on the other hand, patients in general hospitals, who ordinarily remain for short periods of time, were counted at their homes. On the night of April 6, 1970, a special enumeration was performed in missions, flop-houses, detention centers, etc., and persons enumerated therein were counted as residents of the particular place.

Americans who were overseas for an extended period (in the Armed Forces, working at civilian jobs, studying in foreign universities, etc.) are not included in the population of any of the States or the District of Columbia. On the other hand, persons temporarily abroad on vacations, business trips, and the like, were counted at their usual residence.

Persons in larger hotels, motels, etc., on the night of March 31, 1970, were requested to fill out a census form for allocation back to their homes if they indicated no one was there to report them in the census. A similar approach was used for persons visiting in private residences, as well as for Americans who left the United States during March 1970 via major intercontinental air or ship carriers for temporary travel abroad.

In addition, information on persons away from their usual place of residence was obtained from other members of their families, landladies, etc. If an entire family was expected to be away during the whole period of the enumeration, information on it was obtained from neighbors. A matching process was used to eliminate duplicate reports for a person who reported for himself while away from his usual residence and who was also reported at his usual residence by someone else.

BOUNDARIES

The data shown for 1970 relate to the boundaries of the areas as existed on January 1, 1970. As nearly as

possible, 1960 data for the same areas have been adjusted to conform to the 1970 definitions. However, it was not feasible to compile 1960 information for small pieces of territory transferred from one jurisdiction to another as a result of county and city boundary changes. Where such discrepancies exist note is made in table footnotes. "Extended cities" constitute a special boundary problem discussed below.

COUNTIES

The primary divisions of the States are, in general, termed counties, but in Louisiana these divisions are known as parishes. There are no counties in Alaska. In this State, data are shown for statistical areas which are county equivalents designated as census divisions; they were developed for general statistical purposes through the cooperation of the State and the Census Bureau. In four States (Maryland, Missouri, Nevada, and Virginia), there are one or more cities which are independent of any county organization and thus constitute primary divisions of their States.

STANDARD METROPOLITAN STATISTICAL AREAS

In this report statistics are shown for standard metropolitan statistical areas (SMSA's) except in some tables for New England States where the metropolitan State economic area or nearest equivalent whole county is substituted for the SMSA.

The population living in SMSA's is designated as the metropolitan population. This population is subdivided as "inside central city or cities" and "outside central city or cities." The latter area is frequently referred to in the text of this report as "suburbs" or "suburban ring." The population living outside SMSA's constitutes the non-metropolitan population.

The Bureau of the Census recognizes approximately 250 standard metropolitan statistical areas in the 1970 census. This number includes the 231 SMSA's (including three in Puerto Rico which are not covered in this series) as defined and named in the Bureau of the Budget publication, *Standard Metropolitan Statistical Areas: 1967*, U.S. Government Printing Office, Washington, D.C. 20402. Also included are two SMSA's as defined by the Bureau of the Budget in January 1968: Biloxi-Gulfport, Miss. and Vineland-Millville-Bridgeton, N.J. In addition, a number of SMSA's are being defined on the basis of the results from the 1970 Census.

Except in New England States, a standard metropolitan statistical area is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are socially and economically integrated with the central city. In a few cities where portions of

counties outside the SMSA as defined in 1967 were annexed to the central city, the population living in those counties is not considered part of the central city. In the New England States, SMSA's consist of towns and cities instead of counties. Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. For the complete description of the criteria used in defining SMSA's, see the Bureau of the Budget publication cited above.

STATE ECONOMIC AREAS

For the New England metropolitan areas represented in some of the tables of these reports, the SMSA has been replaced by the metropolitan State economic area (SEA) (see U.S. Census of Population, 1960, *State Economic Areas*, PC(3)1A.) Where a metropolitan SEA has not been defined, the nearest equivalent county has been used. State summaries by metropolitan and nonmetropolitan residence will, therefore, be found to vary according to whether the information contained in the tables was available for SMSA's directly or for counties only. Population tables 2,3, and 4 contain metropolitan SEA totals, while Housing table 5 shows SMSA totals. Under both systems, figures for central cities are the same.

ANNEXATIONS

A problem of definition exists with respect to some of the central cities shown in these reports. This problem arises as a consequence of annexations of territory made by cities during the 1960-70 decade. Most often, detailed population and housing characteristics from the 1960 census could not be reproduced for the annexed areas. 1960 data shown for central cities in the tables of this report thus relate to those cities as defined at the time of that census, and 1970 data refer to cities as they were defined for the 1970 census.

To clarify the impact of annexation on population change for central cities, a text table has been prepared. It shows 1970 population in current boundaries and within 1960 boundaries for central cities which annexed population. Population change within a consistently defined area, that is, excluding the effect of annexation, can then be obtained.

Since 1960, two cities have annexed the entire county in which they were located: Jacksonville, Fla. (whose boundaries in 1970 are coterminous with Duval County) and Nashville, Tenn. (whose boundaries are now coterminous with Davidson County). Indianapolis, Ind. annexed all parts of Marion County except for Beech Grove, Lawrence, Speedway, and Southport, whose combined 1960 population amounted to 31,600 out of a county total of 698,000. For these three cities (Jacksonville, Nashville, and Indianapolis), 1960 data are presented in terms of their 1970 bound-

aries. Data from the 1960 census for Duval and Davidson Counties were substituted for Jacksonville and Nashville cities as they were defined at the time of the 1960 census. Indianapolis was also considered to be coterminous with Marion County as the effect of including the four places listed above was not great enough to require a special adjustment.

EXTENDED CITIES

A number of cities contain territory essentially rural in character. The classification of all the inhabitants and housing of such cities as urban would include in the urban category persons and housing units in areas primarily rural in character. The Census Bureau therefore established certain rules to identify such cities—which are designated as “extended cities”—and to separate each into its urban and rural portions. As a concomitant of this approach, when an extended city is the central city of an SMSA, most of the 1970 census reports show only the urban portion as the central city. In the present report, however, the entire (or “legal”) city is shown as the central city because the focus here is on comparisons with 1960, and this type of delineation was not made in 1960. The effect of annexation of these extended cities, which can be especially great, is shown in a text table, where appropriate.

STANDARD CONSOLIDATED AREAS

In view of the special importance of the metropolitan complexes around New York and Chicago, the Nation's two largest cities, several contiguous SMSA's and additional counties that do not appear to meet the formal integration criteria but do have strong interrelationships of other kinds have been combined into the New York-Northeastern New Jersey and the Chicago-Northwestern Indiana Standard Consolidated Areas, respectively. The former consists of Middlesex and Somerset Counties in New Jersey and the following SMSA's: New York, Newark, Jersey City, and Paterson-Clifton-Passaic. The latter consists of the following SMSA's: Chicago and Gary-Hammond-East Chicago.

Population

Age.—The age classification is based on the age of the person in completed years as of April 1 of the census years 1960 and 1970.

Race.—The concept of race as used by the Census Bureau does not denote clear-cut scientific definitions of biological stock. Rather it reflects self-identification by respondents. Since the 1960 and 1970 censuses obtained information on race principally through self-enumeration, the data represent essentially self-classification by people according to the race with which they identify themselves. For persons of mixed parentage who are in doubt as to their classification, the race of the person's father is used. Persons of Mexican or Puerto Rican birth

or ancestry who do not identify themselves as of a race other than white (e.g., American Indian, Negro, etc.) are classified as white. In the three-category grouping shown in this report, the “other” category consists of all races except white or Negro, i.e., American Indian, Japanese, Chinese, Filipino, Korean, Eskimo, etc.

1970 age-race data taken from the published PC(V2) Series of Advance Population Reports were available for two major population groups: “Total” and “Negro”. In presenting comparable age-race statistics for SMSA's and their component parts in the present series of reports, however, race is classified as “white” and “Negro and other races.” This is the classification employed in the 1960 census, except that “nonwhite” was the term used for “Negro and other races.” It has been kept in two tables of this series (tables 3 and 4) either because of the difficulty or inadvisability of substituting “Negro” only for the broader “nonwhite” classification. As an example of one of the difficulties encountered in making this substitution, it was found that 1960 age detail by race could not be reproduced for the Negro population of counties or county substitutes, which are the building blocks of SMSA's. Unpublished 1970 age detail for “other races” was available, however, to construct a “Negro and other races” age distribution which could then be directly compared with the 1960 race classification.

A more detailed comparison of 1960 and 1970 age-race data can be made for certain of the largest cities. The 1960 age distribution of white, Negro, and other races appears in the 1960 Census volumes for all cities of 100,000 total population or more. For each such city which did not experience boundary changes between 1960 and 1970, a comparison of age detail for the three race groups can be made. A special text table has been prepared to show age distributions of “Negro” population and “Other races” where such information may be of particular interest, as for example in cities which had over 10,000 Negroes in 1960 and in cities which had approximately equal numbers of both race groupings in 1960.

Components of Change.—The components of population change shown in table 3—births, deaths, and net migration—are estimates. As such they are subject to certain limitations unlike the census counts contained in the tables of this report. The estimates are based on reported births and deaths by place of residence, 1960 through 1968, compiled and published by the Division of Vital Statistics, National Center for Health Statistics. Since no vital statistics were readily available for 1969 and the first 3 months of 1970, they were extrapolated using a factor of 1.25 times the average of years 1967-68. Births and deaths were then summed to totals for the decade. Births were corrected by color for underregistration, using factors derived from the

National Center's birth registration test of 1950. As a final step, both births and deaths were adjusted to be consistent with independent State estimates for the decade.

Vital statistics by race were not reported for counties where less than 10 percent of the total population were members of Negro and other races or which had populations of less than 10,000 belonging to these races. These counties are not included in the metropolitan-nonmetropolitan summaries for the State nor for the individual SMSA's when shown by race.

The estimate of net migration was derived as a residual by the following formula: Net Migration = Net Change - Births + Deaths. As a residual value, however, the net migration component reflects the net effect of any errors in the data used, such as differential undercount in the 1960 and 1970 censuses, boundary changes, improper allocation of births and deaths by place of residence, and many others.¹

At the county level very few significant boundary modifications are made. Many cities have annexed territory during the past decade, however, and the shifts resulting from annexation are thrown into the migration component. Special attention is given in the text to the effect of boundary changes on the net migration component for central cities.

Housing

Housing units and group quarters.—All living quarters are classified in the census as either housing units or group quarters. Usually, living quarters are in structures intended for residential use (e.g., a one-family home, apartment house, hotel or motel, boarding house, mobile home or trailer, etc.). Living quarters may also be in structures intended for nonresidential use (e.g., the rooms in a warehouse where a watchman lives), as well as in tents, caves, old railroad cars, etc.

A housing unit is a house, an apartment, a group of rooms, or a single room occupied or intended for occupancy as separate living quarters. Separate living quarters are those in which the occupants do not live and eat with any other persons in the structure and which quarters have either (1) direct access from the outside of the building or through a common hall or (2) complete kitchen facilities for the exclusive use of the occupants. The occupants may be a single family, one person living alone, two or more families living together, or any other group of related or nonrelated persons who share living arrangements (except as described in the next paragraph on group quarters). Both occupied and vacant housing units are included in the housing inven-

tory, except that mobile homes, trailers, tents, etc., are included only if they are occupied.

Group quarters are living arrangements for institutional inmates or for other groups containing five or more persons not related to the person in charge. Group quarters are located most frequently in institutions, boarding houses, military barracks, college dormitories, fraternity and sorority houses, hospitals, monasteries, convents, and ships. A house or apartment is considered group quarters if it is shared by the person in charge and five or more persons unrelated to him, or if there is no person in charge, by six or more unrelated persons. Information on the housing characteristics of group quarters is not collected in the census.

Year-round housing units.—In 1970, data on housing characteristics are limited to year-round housing units—all occupied units plus vacant units which are intended for year-round use—because it is difficult to obtain reliable information for the remaining types of units, i.e., units reported as vacant at the time of the census and intended for seasonal occupancy or held for migratory labor.

In 1960, housing characteristics were provided for all units, including vacant seasonal and vacant migratory units.

Occupied housing units.—A housing unit is classified as occupied if a person or group of persons is living in it at the time of enumeration or if the occupants are only temporarily absent, for example, on vacation. However, if the persons staying in the unit have their usual place of residence elsewhere, the unit is classified as vacant. A household consists of all persons who occupy a housing unit.

Population and persons.—“Population in housing units” is the total population less those persons living in group quarters. “Population per occupied unit” is computed by dividing the population living in housing units by the number of occupied housing units; this is also computed separately for the population in owner and in renter occupied units. The caption “Persons” refers to the number of persons occupying the housing unit; the data show the number of housing units occupied by the specified number of persons.

Race.—The classification by race used in the housing table refers to the race of the head of the household occupying the housing unit. Figures on tenure for 1970 are given separately for all households and for Negro heads of households; for 1960, the tenure figures relate to all households and to household heads of “Negro and other races” (excluding white heads of households). In the 1960 census, the term “nonwhite” was used for Negro and other races. Data on change (1960 to 1970) are shown only when the population data by race indicate that the number of Negro households in 1960

¹For a more detailed discussion of the types of errors which affect estimates of net migration derived in this manner, see *Current Population Reports*, Series P-23 No. 7, pages 13 and 14.

constituted a sufficiently large proportion of household heads of Negro and other races to permit meaningful comparison.

Tenure.—A housing unit is "owner occupied" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owner occupied" only if the owner or co-owner lives in it. All other occupied units are classified as "renter occupied," including units rented for cash rent and those occupied without payment of cash rent.

Vacant housing units.—A housing unit is vacant if no one is living in it at the time of enumeration, unless its occupants are only temporarily absent. In addition, a vacant unit may be one which is entirely occupied by persons who have a usual residence elsewhere. New units not yet occupied are enumerated as vacant housing units if construction has reached a point where all exterior windows and doors are installed and final usable floors are in place. Vacant units are excluded if unfit for human habitation because the roof, walls, windows, or doors no longer protect the interior from the elements, or if there is positive evidence (such as a sign on the house or in the block) that the unit is to be demolished or is condemned.

Vacant housing units are classified in this report as either "seasonal and migratory" (i.e., intended for seasonal occupancy or held for migratory labor) or "year-round." The latter are units which, although vacant at the time of enumeration, are usually occupied or are intended for occupancy at any time of the year. A unit in a resort area which is usually occupied on a year-round basis is considered as a year-round unit. Units used only occasionally throughout the year are also considered year-round units.

Year-round vacant units are subdivided as follows: "For sale only," and "for rent" which also includes vacant units offered either for rent or for sale. All other year-round vacant units are included in the total and may be derived by subtracting the sum of the vacant units "for sale only" and "for rent" from the total. Other year-round vacant units include units sold or rented but not yet occupied by the new owner or renter, units held for the occasional use of the owner, and units held off the market for other reasons.

Homeowner vacancy rate.—The homeowner vacancy rate in 1970 is the number of year-round vacant units for sale as a percent of the total homeowner inventory, i.e., all owner-occupied units and year-round vacant units for sale. In 1960, the homeowner vacancy rate was based on vacant units available for sale, i.e., year-round vacant units for sale in sound or deteriorating condition.

Rental vacancy rate.—The rental vacancy rate in 1970 is the number of year-round vacant units for rent as a

percent of the total rental inventory, i.e., all renter-occupied units and all year-round vacant units for rent. In 1960, the rental vacancy rate was based on vacant units available for rent, i.e., year-round vacant units for rent in sound or deteriorating condition.

Rooms.—Rooms to be counted include whole rooms used for living purposes, such as living rooms, dining rooms, kitchens, bedrooms, finished recreation rooms, family rooms, etc. Not counted as rooms are bathrooms, porches, balconies, foyers, halls, halfrooms, kitchenettes, strip or pullman kitchens, utility rooms, unfinished attics, basements, or other space used for storage.

Data on change (1960 to 1970) are not given when the number of vacant seasonal and migratory units that are excluded from the 1970 tabulations is too large to produce meaningful comparisons.

Persons per room.—This is computed by dividing the number of persons in the unit by the number of rooms in the unit. The figures shown refer, therefore, to the number of housing units having the specified ratio of persons per room.

Units in structure.—Statistics on the number of housing units in a structure are presented in terms of one-family houses, number of units in multiunit structures, and mobile homes or trailers.

Data on change (1960 to 1970) are not given when the number of vacant seasonal and migratory units that are excluded from the 1970 tabulations is too large to produce meaningful comparisons.

Plumbing facilities.—The category "with all plumbing facilities" consists of units which have hot and cold piped water, as well as a flush toilet and a bathtub or shower inside the structure for the exclusive use of the occupants of the unit. "Lacking some or all plumbing" means that the unit does not have all three specified plumbing facilities (hot and cold piped water, as well as flush toilet and bathtub or shower inside the structure), or that the toilet or bathing facilities are also for the use of the occupants of other housing units.

For 1960, data on plumbing facilities were derived from information on number of bathrooms. Data for units with all plumbing facilities and with 1.01 or more persons per room are not available from the 1960 reports. Similarly, 1960 data on plumbing facilities are not available by race.

Data on change (1960 to 1970) are not given when the number of vacant seasonal and migratory units that are excluded from the 1970 tabulations is too large to produce meaningful comparisons.

Value.—Value is the respondent's estimate of how much the property (house and lot) would sell for if it were for sale. The term "specified owner occupied" means that in 1970 the value data are limited to owner occupied, one-family houses on less than ten acres, without a

commercial establishment or medical office on the property. Owner occupied cooperatives, condominiums, mobile homes, and trailers are excluded from the value tabulations.

In 1960 in rural territory, units on farms and all units on places of 10 or more acres (whether farm or nonfarm) were excluded from the value tabulations. In 1970, all units on 10 or more acres are excluded, urban as well as rural; consequently the 1970 value tabulations include farm units of less than 10 acres and exclude units in urban areas on 10 or more acres.

Contract rent.—Contract rent is the monthly rent agreed to or contracted for, even if the furnishings, utilities, or services are included. The term "specified renter occupied" means that in 1970 the contract rent data exclude one-family houses on ten acres or more. Renter units occupied without payment of cash rent are shown separately as "no cash rent" in the rent tabulations.

The 1960 rent tabulations excluded farm units and vacant units on 10 or more acres in rural areas. In 1970, all one-family houses on 10 or more acres, whether occupied or vacant and whether urban or rural, are excluded from the rent tabulations.

SOURCES OF DATA

The basic 1970 population and housing data contained in the statistical tables of this series were obtained from

the Advance Reports on Population, PC(V1) and PC(V2), and Housing, HC(V1), issued by the Bureau of the Census for individual States. Certain data on characteristics from those reports are subject to change in the 1970 census PC(1)-B Final Reports on Population and HC(1)-A Final Reports on Housing being issued for States during the spring and summer of 1971.

The PHC(2) Series also contains parallel statistics for 1960, available from published Census sources. 1960 statistics referring to SMSA's have been adjusted to conform to 1970 area definitions. Population and housing characteristics of SMSA's formed during the decade have been reconstructed as of 1960 to complete the comparison with 1970 areas. The source of information regarding criteria for establishment of new SMSA's as well as intercensal adjustments in SMSA boundaries is the Bureau of the Budget publication, *Standard Metropolitan Statistical Areas: 1967*, U.S. Government Printing Office, Washington, D.C. 20402.

Publications of the National Center for Health Statistics were used to develop components of population change. In some cases, supplementary vital statistics were obtained from State health departments.

Some unpublished data from the 1960 Census of Housing were utilized. For those SMSA's which underwent boundary changes from 1960 to 1970, it was necessary to develop a tabulated reprint of 1960 contract rent data on a county basis.
